ArabTeX  
Typesetting Arabic and Hebrew<sup>1</sup>  
User Manual Version 4.00<sup>2</sup>

Klaus Lagally

March 11, 2004

<sup>1</sup>Report Nr. 2004/03, Universität Stuttgart, Fakultät Informatik

<sup>2</sup>This Report supersedes Reports Nr. 1992/06, 1993/11 and 1998/09

## Abstract

Arab<sub>TEX</sub> is a package extending the capabilities of <sub>TEX/LATEX</sub> to generate the Perso-Arabic writing from an ASCII transliteration for texts in several languages using the Arabic script. It consists of a <sub>TEX</sub> macro package and an Arabic font in several sizes, presently only available in the Naskhi style. Arab<sub>TEX</sub> will run with Plain <sub>TEX</sub> and also with <sub>LATEX2S</sub>. It is compatible with Babel, CJK, LyX, the EDMAC package, and Pic<sub>TEX</sub> (with some restrictions); other additions to <sub>TEX</sub> may work, but have not been tried.

Arab<sub>TEX</sub> is primarily intended for generating the Arabic writing, but the standard scientific transliteration can also be easily produced. For languages other than Arabic that are customarily written in extensions of the Perso-Arabic script, some limited support is available.

Arab<sub>TEX</sub> defines its own input notation which is both machine, and human, readable, and suited for electronic transmission and E-Mail communication. However, texts in many of the Arabic standard encodings can also be processed. Arab<sub>TEX</sub> also provides support for fully vowelized Hebrew, both in its private ASCII input notation and in several other popular encodings.

Arab<sub>TEX</sub> is copyrighted by the author, but free. If you use the system for scientific work please give appropriate credit to the software and the author (e.g. in the colophon of a monograph.) We also appreciate a complimentary copy of any scientific work produced with Arab<sub>TEX</sub>.

Arab<sub>TEX</sub> may be redistributed and/or modified under the terms of the LPPL (<sub>LATEX</sub> Project Public License) distributed from CTAN archives in the directory <ftp://ftp.dante.de/tex-archive/macros/latex/base/lppl.txt>, either version 1 of the License, or (at your option) any later version. There is no warranty of any kind, either expressed or implied. The entire risk as to the quality and performance rests with the user.

**Please send error reports, suggestions and inquiries to the author:**

# Chapter 1

## Introduction to Arab $\text{\TeX}$

*Note: This manual describes Version 4 of Arab $\text{\TeX}$ , which in general is upwards compatible to earlier versions. Incompatible features and extensions are flagged by an asterisk in the margin.* \*

Arab $\text{\TeX}$  is a package extending the capabilities of  $\text{\TeX}$ / $\text{\LaTeX}$  to generate an extended Perso-Arabic and/or Hebrew script in addition to the customary left-to-right scripts (called *Roman* in the sequel). Besides Arabic and Hebrew there are provisions for many other languages that use some extensions of the Arabic script; we shall use the term *Arabic* generically to denote any supported right-to-left script, without any cultural or political connotation.

An Arab $\text{\TeX}$  document is usually multi-lingual and may contain right-to-left insertions within left-to-right paragraphs, and vice versa. There are various possibilities to encode right-to-left insertions: in addition to several standard encodings there are also 7-bit ASCII encodings modelled after various transliteration standards (there is more than one convention, so the intended language must be specified).

Arab $\text{\TeX}$ , like  $\text{\TeX}$  and  $\text{\LaTeX}$ , is not a substitute for a word processor, and does not follow the WYSIWYG paradigm (What You See Is What You Get) where the author has complete control on, and therefore is also completely responsible for, every detail of the visual representation of her text. Instead it is an *off-line system* mirroring the classical publication process where an author, concentrating on the content and the structure of her paper only, will deliver a manuscript to the publisher, who will take care of a reasonable visual rendering of the text.

The publisher involved in our case is  $\text{\TeX}$ , the famous typesetting program by D. E. Knuth; and the amount of technical typesetting knowledge embodied in the algorithms of  $\text{\TeX}$  is such that, in general, the author will tacitly accept the resulting output if she had stated her preferences in a sufficiently precise way;

otherwise, the formatting task has to be repeated under changed specifications, as also in the classical case.

$\text{\TeX}$  is easily extensible by providing its own macro programming language, enabling the user to implement packages that contain algorithms embodying additional typesetting knowledge. A prominent example is  $\text{\LaTeX}$  by L. Lamport, a package providing standard formatting styles for several common document classes. One of the basic concepts of  $\text{\LaTeX}$ , but already contained in  $\text{\TeX}$  itself, is “structured markup”: the user generally only indicates the logical structure of the document, whereas the formatting rules are laid down within descriptions of standard document classes.

Arab $\text{\TeX}$ , at the user interface, needs to add only very few features: we provide a way to indicate which parts of the input text are considered to be in Arabic (or some other supported language written from right to left) and thus have to be rendered accordingly, and a way of setting parameters influencing the rendering of Arabic text. Additionally we have to support a representation of the Arabic text that can be handled using the available standard equipment.

Internally, of course, there is much more to it.  $\text{\TeX}$  may be very good at rendering left-to-right texts, but Arabic runs from right to left, so we have to instruct  $\text{\TeX}$  how to do it the other way; and if we want to mix Arabic and traditional left-to-right text within the same paragraph, things can get extremely complicated. This shows indeed: Arab $\text{\TeX}$  is very large and comparatively slow. Fortunately, computer technology is advancing at a high pace, so that the penalty of using very involved algorithms will decrease just by simple waiting; and we thus never were too much concerned about efficiency (even if we tried to avoid the worst blunders).

In order to see how Arab $\text{\TeX}$  works, let us consider a very simple example: Figure 1.1 contains the complete  $\text{\TeX}$  input text, Figure 1.2 the corresponding output. In this example (using  $\text{\LaTeX}$ ) we use a standard “article” format, we activate the Arab $\text{\TeX}$  package, and we set a few options: our text is supposed to be in Arabic, we want to see all vowel marks (this is not always done in Arabic printing), we additionally want to get the scientific transcription, and, of course, the Arabic writing. The document proper consists of a centered headline and a sequence of short Arabic paragraphs, separated in the input by blank lines<sup>1</sup>.

This example is *not* typical insofar as we produce both the scientific transcription of the text, and the Arabic writing, from the same input at the same time, interleaving them. This is rarely required; but in our example it allows us to demonstrate that the input notation is very closely related to the transcription. Details about this correspondence are covered in Chapter 4. What indeed *is* typical is the fact that, apart from the centered headline, we supplied no formatting information whatever;  $\text{\TeX}$  will take care of that.

---

<sup>1</sup>If you happen to be curious and cannot read Arabic: the text contains a traditional story about a somewhat silly person named Ġuhā, trying *not* to lend his donkey to a friend, and failing.

```

\documentclass[12pt]{article}
\usepackage{arabtex}

\begin{document}

\setarab    % choose the language specific conventions
\vocalize   % switch diacritics for short vowels on
\transtrue  % additionally switch on the transliteration
\arabtrue   % print arabic text ... is on by default anyway

 fa-'lhimāru laysa hunā 'l-yawma.*  
 أَنَا آسِفٌ جِدًا أَنِّي لَا أُسْتَطِيعُ أَنْ أُحْقِقَ لَكَ رَغْبَتَكَ ، فَالْحِمَارُ لَيْسَ هُنَا الْيَوْمَ .  
*wa-qabla ɔan yutimmu ğuhā kalāmahu bada'a 'l-himāru yanhaqu fi 'stablihi.*  
 وَقَبْلَ أَنْ يُتِمَّ جُحَّا كَلَامَهُ بَدَأَ الْحِمَارُ يَهْتَقُ فِي اصْطَبَلِهِ .  
*fa-qāla lahu ɔadīquhu:*  
 فَقَالَ لَهُ صَدِيقُهُ :

*innī ɔasmā'u himāraka yā ğuhā yanhaqu.*  
 إِنِّي أَسْمَعُ حِمَارَكَ يَا جُحَّا يَهْتَقُ .  
*fa-qāla lahu ğuhā:*  
 فَقَالَ لَهُ جُحَّا :

*jarībun ɔamruka yā ɔadīqi! ɔa-tuṣaddiqu 'l-himāra wa-tukadidibuni?*  
 غَرِيبٌ أَمْ رَكَّا يَا صَدِيقِي ! أَتَصَدِّقُ الْحِمَارَ وَتُكَذِّبُنِي ؟

Figure 1.2: Sample ArabTeX output

## Chapter 2

# Input to ArabTeX

ArabTeX is activated by the command `\input arabtex` (with Plain TeX) or `\usepackage{arabtex}` (with L<sup>A</sup>T<sub>E</sub>X). After activating ArabTeX, select one of the language-specific Arabic writing styles, e.g., `\setarab` (see Section 3.2). Your modified TeX/L<sup>A</sup>T<sub>E</sub>X system will recognize the following items:

- standard TeX/L<sup>A</sup>T<sub>E</sub>X text and commands,
- *Arabic quotations*<sup>1</sup> as arguments to the command `\RL{ }` (read: “right-to-left”) within a *Roman* paragraph. A quotation may also be bracketed by `<` and `>` (deprecated!) or by `\<` and `\>` except inside a L<sup>A</sup>T<sub>E</sub>X `{tabbing}` environment<sup>2</sup>. An Arabic quotation may not contain more than a single paragraph of right-to-left text and forms a new TeX group, so any assignments will be local by default.
- longer Arabic text segments called *Arabic environments*, which are bracketed by the commands `\begin{RLtext}` and `\end{RLtext}` (or also `\begin{arabtext}` and `\end{arabtext}` with the same meaning) (even when using Plain TeX!). An *Arabic environment* consists of one or more paragraphs separated by blank lines or `\par` commands. It forms a group, so assignments will be local by default.

*Arabic quotations* and *Arabic environments* will be called *Arabic contexts* in the sequel.

---

<sup>1</sup>The former restriction that quotations must fit on the current line no more applies.

<sup>2</sup>Quotations closed by `>` may not contain nested insertions; also observe that `\<` must be matched by `>`, *not* by `\>`!

## 2.1 Arabic text elements

Every *Arabic paragraph* and every *Arabic quotation* is a sequence of the following kinds of *Arabic items*, separated by white space or single newlines:

- isolated punctuation marks, interpreted as the corresponding Arabic punctuation mark;
- \*     • “numbers”, i.e. character sequences starting with a digit, and possibly continued by digits, commas, hyphens, or slashes. A “number” will be processed using the normal writing sequence from left to right; however, a final punctuation mark will be split off and processed separately.
- “Arabic quotes” coded as two left quotes or two right quotes each, or as `\lq` and `\rq`. They should be written directly adjacent to a word.
- “words”, i.e. character sequences starting with a letter or a special (non-digit) character followed by a letter. A final punctuation mark will be split off and processed separately. The (coded) characters of a word will in the output be arranged from right to left.
- a sequence of Arabic text elements (words, numbers, and special characters) enclosed in curly braces `{` and `}`. This introduces a new level of  $\text{\TeX}$  grouping; otherwise the constituents are processed normally. This feature may be nested.

Output from all items will be arranged from right to left, lines will be broken as necessary.

Inside an *Arabic Environment*, or in an *Arabic quotation*, you may also have:

- ArabTeX commands with or without parameters. These will be executed immediately.
- Some, but not all,  $\text{\TeX}/\text{\LaTeX}$  commands (see below). These will be executed immediately.
- \*     • Short mathematical insertions, bracketed by `\(` and `\)`, or by two *single* \$ signs. They must fit on one output line and are processed as usual.
- \*     • Displayed equations bracketed by `\[` and `\]`, or by `$$`.
- short left-to right (“Roman”) *quotations*, containing text and possibly also  $\text{\TeX}/\text{\LaTeX}$  commands, as argument to `\LR{}` (read: “left-to-right”) or bracketed by `<` and `>` (deprecated!)<sup>3</sup>. These introduce a new level of grouping, so if they contain any  $\text{\TeX}/\text{\LaTeX}$  assignments the effects of these will be local by default. When using `<` and `>` this feature is not available *within* an *Arabic quotation*. The alternate notation `\<` is *not* provided.

---

<sup>3</sup>Quotations closed by `>` may not contain nested insertions.

## 2.2 Commands within an *Arabic context*

ArabTeX will process all input text contained within an *Arabic context*, even all TeX/LaTeX commands. These must thus be known to ArabTeX, since their meaning, or their implementation, might be different there from the usual interpretation. Thus ArabTeX has to provide a private implementation for any admissible command, and will normally try to reuse parts of the existing mechanisms. As a consequence, any incompatible changes to Plain TeX and/or LaTeX might require corresponding changes to ArabTeX too.

A control sequence inside an *Arabic context* may be of the following kinds. Note that commands which are intrinsically vertical, like e.g., `\vskip`, make no sense within *Arabic quotations*, and may lead to unpredictable effects there.

- ArabTeX option changing commands. These may also be used outside an *Arabic Context*, and usually follow TeX's grouping rules. Changes of language, Arabic and Hebrew font, input encoding, and transliteration conventions are *global*. \*
- `\backslash` for a line break; the current line will be padded out on the left with spaces.
- `\|` or `\break` for a line break; the current line will be spread out. If it comes out very badly spaced, automatic stretching might help (see Section 8). The current paragraph will *not* be reformatted.
- `\indent` or `\par` (or a blank line) for a new paragraph, `\noindent` for a new paragraph without indentation.
- `\emphasize{group_of_Arabic_items}` or `\emph{items}` will put a bar over the indicated group of *Arabic items*.
- `\setnash`, `\setnashbf`, `\setnastaliq` and other font selection commands, see Section 3.3.
- size changing LaTeX commands like `\large` etc., only if LaTeX is used!
- the following commands: `\footnote` (observe that the syntax for Plain TeX and LaTeX is different!), `\marginpar` (even with Plain TeX, analogous to the LaTeX usage).
- the TeX/LaTeX commands `\smallskip`, `\medskip`, `\bigskip`, `\input`, `\hfill`, `\hfil`, `\vfill`, `\vfil`, `\_` (for a space), `\space`, `\,` (small space), `\newpage`, `\clearpage`, `\pagebreak` with their usual meaning.
- `\mbox{text}` puts the *text* argument into a box that will not be split.
- `\nospace`, `\unskip` will place the adjacent items in the output in direct contact, without any intervening space, except in case of a line break.

- `\hspace{width}` will introduce the indicated amount of spacing in the output. The same is true for `\vspace`, `\hskip`, and `\vskip`.
- `\spreadbox{width}{text}` spreads out the *text* to the indicated *width*. This may be useful e.g., when typesetting poetry.  
`\spreadbox{width}{text \hfill }` will inhibit the spreading,  
`\spreadbox{width}{\hfill text \hfill }` will center the *text*.  
`\spreadbox{width}{\hfill }` or `\spreadbox{width}{\_}` just introduces the indicated amount of horizontal space, as will `\hspace{width}`.  
If two boxing commands follow each other without any intervening blank space in the input, there will also be no resulting space between the boxes in the output.
- `\centerline{text}` will start a new line whose contents are centered.
- `\spreadline{text}` will start a new line whose contents are spread out over the whole width of the page. It is approximately equivalent to `\spreadbox{\hsize }{text}`.

User defined commands, even if they require parameters, may be called directly within an *Arabic context* if they have been previously announced to the ArabTeX processor by `\allowarab{command_name}`. After substituting the parameters they are expanded exactly once, and the expansion text will be processed by ArabTeX again, so it must be legal ArabTeX input text.

Even if not announced previously, user defined commands may also be called by `\docommand{command_name and parameters}`. The command is expanded exactly once,<sup>4</sup> and the expansion text, after suitable substitution of parameters, will be processed by ArabTeX again.

Parameter assignments inside an *Arabic context* may be performed by `\doassign{parameter}{value}`. The effect is normally local except if the form `\doassign{\global parameter}{value}` is used.

Any non-recognized command will generate an error message and will be echoed verbatim in the output. Even though ArabTeX tries hard to get into synchronization again, additional spurious errors may occur.

Inside an *Arabic Context* normally no further L<sup>A</sup>T<sub>E</sub>X or ArabTeX environment may be nested; this restriction does not apply to the experimental L<sup>A</sup>T<sub>E</sub>X document classes `arabrep.cls`, `arabart.cls`, `arabbook.cls` (see Section 9.1) which are provided for right-to-left documents.

For a list of all available commands, consult the Index to this report. As a reminder, the command `\arabstat` will cause a list of all commands that are presently valid inside Arabic text to appear in the TeX log file.

---

<sup>4</sup>This is no strong restriction as the expansion may contain `\docommand` calls again.

## Chapter 3

# Running Arab $\text{\TeX}$

### 3.1 Activating Arab $\text{\TeX}$

Arab $\text{\TeX}$  can be used both with Plain  $\text{\TeX}$  and with  $\text{\LaTeX}$ , but is activated differently in both cases.

With Plain  $\text{\TeX}$ , a small loader program is activated by the command `\input arabtex` at the beginning of an input text. It will define a default font, prepare a minimal environment simulating the (very few)  $\text{\LaTeX}$ -like features needed, and load the Arab $\text{\TeX}$  macro files. With  $\text{\LaTeX}_2\epsilon$  the command `\usepackage{arabtex}` will do all the loading.

If Hebrew mode (see Section 7) is required, use `\input hebtex.tex` resp. `\usepackage{hebtex}` instead. The required modules of Arab $\text{\TeX}$  will be loaded automatically.

With Plain  $\text{\TeX}$  *only*, add `\input apatch.sty` at the beginning of your document proper, after reading any other auxiliary files, to get the most recent corrections.

Arab $\text{\TeX}$  will load many internal files automatically, and defines a large numbers of internal commands. These all contain an “at”-sign (@) within their names and thus should not interfere with user defined commands. Collisions with other macro packages are possible, however, and may lead to surprises and interesting effects.

Arab $\text{\TeX}$  tries to diagnose the presence of some other packages with which it could run into conflicts, and sometimes locally modifies itself accordingly. For this to be possible, in case of doubt the Arab $\text{\TeX}$  package should be loaded last.

Users still running  $\text{\LaTeX}$  2.09 (horror!) should either add the option `arabtex` to the `\documentstyle` command, or rather upgrade to  $\text{\LaTeX}_2\epsilon$ .

## 3.2 Language selection

The processing of input text in ASCII transliteration encoding is somewhat language dependent. Thus before the first *Arabic quotation* or *Arabic environment* you have to indicate the desired processing mode by one of the language selection commands `\setarab`, `\setfarsi`, `\seturdu`, `\setpashto`, `\setmaghribi`, etc.,<sup>1</sup> or `\setverb` (no special processing; see however Section 4.2). The processing mode may be changed at any time, even inside an *Arabic environment* or an *Arabic quotation*.

*Arabic insertions* are generally included in `\RL{ }` or bracketed by `\<` and `\>`. By selecting a language, the symbols `<` and `>` are also activated as shorthands to bracket short insertions in the chosen language. Whereas this is usually convenient, it also has some drawbacks: the angle brackets can thus no more be used for other purposes, except in mathematical mode where they retain their normal meaning as relational operators. To return them to their normal mode of operation, you can deselect them by `\setnone`.<sup>2</sup>

For further details on supported languages, see Section 6.

## 3.3 Font selection

For producing the extended Arabic script ArabTeX uses a special strategy to build up character shapes from a collection of fragments, which normally do *not* correspond to individual character glyphs. Therefore none of the available free or commercial Arabic fonts can be used; we provide our own “pseudo-fonts”.

Presently the following pseudo-fonts are available:

- "xnsh14" is the default,
- \*     • "xnsh14bf" is a bold-face version of "xnsh14",
- "nash14" is an older version of "xnsh14" containing less glyphs and only provided for compatibility with existing documents.
- "nash14bf" is a bold-face version of "nash14".

The font "xnsh14" the default; use `\setnashbf` or `\bf` to switch to bold-face. `\setnash` or `\rm` (!) will switch back.

---

<sup>1</sup>We would prefer to use a single switching command like `language`, `\setlanguage`, or `\selectlanguage`, but these names have already been preempted by TeX3 and the Babel package.

<sup>2</sup>Note for advanced TeX users: All language selecting commands except `\setnone` set the character `<` to be active. If *Arabic insertions* are not needed, or are always started with `\<` or `\RL`, the user may reuse the command `<` for other purposes, or deactivate it by `\setnone` or `\catcode '\<=12` to return it to its normal meaning.

With Plain T<sub>E</sub>X the fonts are available by default at 14 point size only, which cooperates well with the "cm" fonts at 10 points. Additional sizes are defined within the file "*arabtex.tex*"; they can be activated whenever needed by the command \setarabfont{*font*}.

With L<sup>A</sup>T<sub>E</sub>X, the font size changing commands will also operate on the Arabic fonts.

We strongly recommend migrating to "xnsh14" and "xnsh14bf"; the command \oldarabfont will switch to the old fonts, if necessary, and \newarabfont will restore the default. The fonts "nash14" and "nash14bf" are of inferior quality \* and will be phased out gradually.

All fonts indicated presently are in the Naskhi style; we had started to write a Nastaliq font for Persian and Urdu, but ran into grave implementation problems, yet unsolved.

Due to a donation by Taco Hoekwater, the fonts "xnsh14" and "xnsh14" are also available in Postscript T1 format. Their use is highly recommended when using a Postscript interpreter, or converting the output to PDF format; readability is dramatically improved.

In Hebrew mode (see Section 7) you can use the standard fonts available on CTAN (after installing them locally). As defaults the fonts "hclassic" and "hcaption" are provided with ArabT<sub>E</sub>X; these fonts contain vowel points. Also \* for the other fonts vowel points are provided.

## Chapter 4

# Input encoding conventions

### 4.1 ASCII Transliteration encoding

The ASCII input notation for Arabic text has been modelled closely after the transliteration standards ISO/R 233 and DIN 31635. These standards do not guarantee unique re-transliteration and are also not 7-bit ASCII compatible, therefore some modifications were necessary. These follow the general rules:

- whenever the transliteration uses a single letter, code that letter;
- whenever the transliteration uses a letter with a diacritical mark, put the punctuation character most closely resembling the diacritical mark *before* the letter (and *not* behind it as in some other coding proposals, as otherwise the readability of the input would suffer, and the encoding could become ambiguous).
- use capital letters for writing variants.

#### 4.1.1 Standard Arabic and Persian characters

The standard encodings for Arabic and Persian consonants are given in Table 4.1 and Table 4.2.

- For long vowels, we use the capital letters `<A>`, `<I>`, `<U>` or also `<aa>`, `<iy>`, `<uw>`, with the same meaning.
- To get the defective writing of long vowels, use `<_a>`, `<_i>`, `<_u>`.
- *'alif maqsūra* is `<_A>` or `<Y>`.

a	ا	a	'alif	b	ب	b	bā'	p	پ	p	pā'
t	ت	t	tā'	_t	ث	ت	تā'	^g	ج	ḡim	
.h	ح	h	hā'	_h	خ	ه	هā'	d	د	d	dāl
_d	ذ	d	dāl	r	ر	r	rā'	z	ز	z	zāy
s	س	s	sīn	^s	ش	ش	šīn	.s	ص	ش	šād
.d	ض	d	dād	.t	ط	ت	tā'	.z	ظ	ز	zā'
'	ع	'	'ayn	.g	غ	ج	ḡayn	f	ف	f	fā'
q	ق	q	qāf	v	ڦ	v	vā'	k	ڪ	k	kāf
g	گ	g	gāf	l	ڙ	ل	lām	m	ڻ	m	mīm
n	ڻ	n	nūn	h	ڻ	ه	hā'	w	و	w	wāw
y	ي	y	yā'	_A	ڻ	ا	'alif maqṣūra	T	ڻ	ه	tā' marbuta

Table 4.1: Standard encodings for Arabic and Persian consonants.

- The short vowels *fathā*, *kasra*, *damma* are coded `<a>`, `<i>`, `<u>` and need not normally be written except in the following cases:
  - at the beginning of a word where they generate *'alif*,
  - adjacent to *hamza* where they will influence its carrier,
  - when the transliteration is required,
  - in the `\vocalize` and `\fullvocalize` modes.
- *tanwīn* is coded `<aN>`, `<iN>`, or `<uN>`. A silent *'alif*, if required, is supplied automatically; it may also be explicitly written: `<aNA>`. Likewise, a silent *wāw* may be written `<NU>` as in `<'amruNU>`.
- *hamza* is denoted by a single *right quote* `<'>`. After selecting the language by `\setarab` the carrier of *hamza* will be determined from the context according to the rules for writing Arabic words; if that is not wanted, “quote” the *hamza* (see Section 4.1.3 below). In the `\setverb` mode, the carrier of *hamza* is determined by the following input character; see Section 4.2.

c	ڇ	c	<i>hā'</i> with <i>hamza</i>
^c	ڇ	č	<i>gīm</i> with three dots (below)
,c	ڇ	ć	<i>hā'</i> with three dots (above)
^z	ڙ	ž	<i>zāy</i> with three dots (above)
^n	ڻ	ñ	<i>kāf</i> with three dots (Ottoman)
^l	ڙ	ł	<i>lām</i> with a bow accent (Kurdish)
.r	ڙ	ŕ	<i>rā'</i> with a bow below (Kurdish)

Table 4.2: Additional encodings generally available.

- \* • *madda* on '*alif*' is generated by a right quote (*hamza*) before <A>: <'A>. It may also be written <^A>; likewise, <^I> and <^U> will produce *madda* on *yā'* and on *wāw*, as required in some older writing conventions.<sup>1</sup>
- \* • The coding <‘> for '*ayn*' is a single *left* quote, beware of confusing it with *hamza*!
- \* • The “invisible consonant” <|> may be inserted in order to break unwanted ligatures and to influence the *hamza* writing. It will not show in the Arabic output or in the transliteration. At the beginning of a word it will suppress a following short vowel; otherwise it acts like a consonant.
- \* • The sequence <\,> will insert a small space, as does <" |> (see Section 4.1.3 below). The adjacent characters will not be connected.
- \* • *šadda* is indicated by doubling the appropriate letter coding. Therefore two equal consonants in sequence have to be separated by a short vowel indicator or <|> even in \novocalize mode.
- \* • The definite article is separated from the following word by a hyphen. It may be written in the assimilated form (if it exists): <as-salĀmu>, or always as <al->; in that case a subsequent “sun letter” must be doubled: <al-ssalĀmu>, to receive a *šadda*, and to prevent a *sukūn* on the *lām*. The transliteration in both cases is identical.
- \* • Hyphens <-> are used for tying words together and for separating prefixes and the article; in these cases they start a new word. Hyphens can also be used to indicate inflectional endings, a connecting vowel in Arabic, or an

<sup>1</sup>The former use of <^A>, <^I>, and <^U> has been discontinued in ArabTeX version 4.

*izāfet* connection in Persian. Hyphens will show up in the transliteration. Additionally, at the beginning and/or the end of an otherwise isolated word they enforce the use of the connecting form of the adjacent letter (if it exists), like e.g. in the date <1400 h->.

- A double hyphen <--> between two otherwise joining letters will break any ligature and will insert a horizontal stroke (*tatwil*, *kašīda*) without appearing in the transliteration. It may be used repeatedly. See also Section 8.5: automatic stretching.

For special applications, it can also be coded <B>; and <|B> will behave like any ordinary consonant and may carry vowel indicators, *tanwīn*, *sukūn*, and, in the combination <|BB>; *šadda*.

### 4.1.2 Vowelization

There are three modes of rendering short vowels:

- **\fullvocalize:**
  - Every short vowel written will generate the corresponding diacritical mark *fathā*, *kasra*, *damma*, except if quoted.
  - If <N> follows a short vowel, the corresponding form of *tanwīn* is generated instead.
  - Defective writing: The coding <\_a> will produce a *Qur'an 'alif* accent (also called *dagger 'alif*) instead of an explicit 'alif character which would be coded <A> or <aa>. Likewise, <\_i> will produce a small 'alif below the preceding consonant in place of <I> (<iy>), <\_u> will produce an inverted *damma* in place of <U> (<uw>).
  - If a long vowel follows a consonant, the corresponding short vowel is implied. The long vowel itself carries no diacritical mark.
  - If no vowel is given after a consonant, *sukūn* will be generated except if a double quote precedes the next consonant. The *lām* of the definite article receives no *sukūn* if a doubled “sun letter” follows.
  - 'alif at the beginning of a word carries *waṣla* instead of the vowel indicator if the preceding word ended with a vowel.
- **\vocalize:** As above, but *sukūn* and *waṣla* will not be generated except if explicitly indicated by “quoting” (see section 4.1.3).
- **\novocalize:** No diacritics will be generated except if explicitly asked for by “quoting” (see section 4.1.3).

In all modes, a doubled consonant will generate *šadda*, and <'A> always generates *madda* on *'alif*.

After <aN> the silent *'alif* character is generated automatically if required. The silent *'alif* may also be explicitly indicated by <aNA>, or coded literally as <A> in \novocalize mode. If a silent *'alif maqsūra* is wanted instead, write <aN\_A>, <aNY>, <\_A> or <Y>.

The *tanwīn fathā* is normally positioned on the last consonant of the word, even if a silent *'alif* follows. If it is instead supposed to go onto the *'alif* as required by some modern Arabic writing conventions, or in Persian, this behaviour can be achieved by the option \newtanwin. The option \oldtanwin will restore the classical behaviour.

A silent *'alif* after *wāw* is indicated by <UA> or <WA> (with a capital <W>!).

#### 4.1.3 Quoting

In \novocalize mode (see Section 4.1.2), a double quote <"> will modify the meaning of the following character as follows:

- if a short vowel follows, the appropriate diacritical mark *fathā*, *kasra*, *damma* will be put on the preceding character.

- If <N> follows the short vowel, the appropriate form of *tanwīn* will be generated instead.
- At the beginning of a word, *'alif* is assumed as the first character.

- if the following character is a single right quote, a *hamza* mark will be put on the preceding character even if in conflict with the *hamza* rules.

At the beginning of a word, <"'> will generate an isolated *hamza*.

- if the following character is the “invisible consonant” <|>, the connection between the adjacent letters will be broken and a small space inserted. This can also be denoted <\,> instead of <"|>.

At the beginning of a word, *'alif* with *waṣla* will be generated.

- otherwise: a *sukūn* will be put on the preceding character. The following character will be processed again.

The double quote will not show up in the transliteration.

In \vocalize mode, (see Section 4.1.2), quoting will turn a short vowel *off*; likewise, in \fullvocalize mode, quoting will also turn a *sukūn* off. Put in other words: quoting will toggle the generation of short vowel indicators and *sukūn* on and off.

#### 4.1.4 Ligatures

There is no way to explicitly enforce ligatures, as a large number of them are generated automatically. The results will not always look satisfactory, so we recommend inspecting the output after the first run. Any unwanted ligature can be suppressed by interposing the invisible consonant <|> between the two letters otherwise combined into a ligature. After \ligsfalse, in the middle of a word fewer ligatures will be produced; for some texts this looks better. You can return to the normal strategy by \ligstrue.

#### 4.1.5 Coding examples for Arabic<sup>2</sup>

**Short vowels** *fatha*, *kasra*, *damma* are denoted, as in the transliteration, by the small letters a, i, u:

mana'a مَنْعَ manā'a, \_dahaba دَهَبَ dahaba, ^sariba شَرِبَ šariba,  
 qabila قَبْلَ qabilā, 'a.zuma عَزُومَ azuma, 'alu عَلُوْ alu, bal بَلْ bal,  
 ni'ma نِعْمَ ni'ma, yaktub يَكْتُبْ yaktub.

**Long vowels** ā, ī, ū are denoted by capitals A, I, U or by aa, iy, uw:

qAtala فَاتَّالَ qātala, nUzi'a نُوزِيَّا nūzī'a, lUmI لُومِي lūmī,  
 sIrI سِيرِي sīrī; lawmI لَوْمِي lawmī, sayrI سَيْرِي sayrī.

**Alif maqsūra** is coded as \_A (or Y.)

ram\_A رَمَيْ ramā, \_dikr\_A ذَكْرِي dikrā, 'al\_A عَلَيْ alā, bal\_A بَلِي balā.

**Silent 'alif:** The suffixes -ā, -aw of the verb are denoted UA, aW or aWA:

katabUA كَتَبُوا katabū, yaktubUA يَكْتُبُوا yaktubū,  
 ramaWA رَمَوْا ramaw, yalqaW يَلْقَوْا yalqaw.

**The defective notation of** ā, ī, ū **can be indicated by** \_a, \_i, \_u **and leads to the appropriate spelling:**

dAru-h\_u دَارُهُ dāru-hū, ri^gli-h\_i رِجْلِهِ rigli-hī,  
 however: ramA-hu رَمَاهُ ramā-hu, yarmI-hi يَرْمِيهِ yarmī-hī;  
 \_dih\_i هِذِهِ dihī, h\_a\_dih\_i هِذِهِ hādihī, tih\_i تِهِ tihī, hAtih\_i هَاهِهِ hātihī,  
 rabb\_i رَبِّي rabbī, .sAl\_i حَالِي sālī; hum\_u هُمْ humū;

---

<sup>2</sup>Most of the examples are taken from: Wolfdieter Fischer, Grammatik des Klassischen Arabisch, 2. Auflage, Verlag Otto Harrassowitz, Wiesbaden 1987.

qiy\_amaTuN قِيَمَةٌ *qiyāmatun*, 'il\_ahuN إِلَهٌ *ilāhun*,  
 sam\_awAtuN سَمْوَاتٌ *samāwātun*, \_tal\_a\_tuN ثَلَاثٌ *talātun*,  
 lakin h\_a\_dA لَكِنْ *lākin*, hādā, 'al-l1\_ahu إِلَهٌ *al-lāhu*,  
 'al-rra.hm\_anu أَرْحَمُونْ *ar-rahmānu*, \_d\_alka ذَلِكَ *dālika*.

To reproduce the historical writing correctly, a silent long vowel or 'alif *maqṣūra* after \_a receives no *sukūn* and is ignored in the transliteration:

.sal\_aUTuN حَيْوَةٌ *salātun*, .hay\_aUTuN حَيْوَةٌ *hayātun*,  
 zak\_aUTuN زَكْوَةٌ *zakātun*, mi^sk\_aUTuN مِشْكَوَةٌ *miškātun*,  
 ar-rib\_aU أَرْبَوْ *ar-ribā*, tawr\_aITuN تَوْرِيَةٌ *tawrātun*,  
 ram\_aYhu رَمَهُ *ramāhu*, sIm\_aYhum سِيمَهُ *sīmāhum*.

The short vowel u can be written as a long vowel by \_U:

'\_U1\_A أُولَى *ulā*, '\_U1A' أُولَاءِ *ulā'i*, '\_U1U أُولُو *ulū*,  
 '\_U1Aka أُولَاكَ *ulāka*, '\_U1A'ika أُولَائِكَ *ulāika*.

**Tanwīn:** The indefinite endings -un, -in, -an are written -uN, -iN, -aN or aNA. Silent 'alif in -an may be indicated by A or omitted; if necessary it is supplied from the context.

ra^guluN رَجُلٌ *rağulun*, ra^guliN رَجُلٌ *rağulin*, ra^gulaN رَجُلًا *rağulan*,  
 madInaTaN مدِينَةٌ *madīnatān*, ^gamIlaTaN حَمِيلَةٌ *ġamīlatān*,  
 'i\_daN إِذَا *iðā*, samA'an شَمَاءٌ *samā'an*.

There is a special case:

ribaNU رَبُّو *riban*; 'amruNU عَمْرُو *amrun*, 'amriNU عَمْرُو *amrin*,  
 however: 'amraN عَمْرًا *amran*.

**Tanwīn fatha** is traditionally put on the last consonant even if a silent 'alif follows. Some modern conventions, and also Persian practice, require to put it on the 'alif in this case. This behaviour may be switched on by \newtanwin, and off by \oldtanwin. \newtanwin mode is the default for Persian.

ra^gulaN رَجُلًا *rağulan*, 'i\_daN إِذًا *iðā*.

A silent 'alif *maqṣūra* after *tanwīn* is written aNY or aN\_A:

hudaN هُدَى *hudan*, fataN\_A فَتَى *fatan*;

compare: al-hudY الْهُدَى *al-hudā*, 'al-fat\_A الْفَتَى *al-fatā*.

**Tā'** *marbuta* is denoted by T:

kalimaTuN كِلْمَةٌ *kalimatun*, kalimaTiN كِلْمَةٌ *kalimatin*,  
 kalimaTaN كِلْمَةٌ *kalimatan*; fatATuN فَتَّاْنٌ *fatatun*,  
 fatATiN فَتَّاْنٌ *fatatin*, fatATaN فَتَّاْنٌ *fatatan*.

**Hamza** is indicated by ' ; its carrier is determined by the context:

'amruN أَمْرٌ *amrun*, 'ibiluN إِبْلٌ *ibilun*, 'u\_htuN أَخْتُ *uhtun*;  
 ra'suN رَأْشٌ *rasun*, 'ar'asu رَأْشٌ *arasu*, sa'ala سَالٌ *saala*,  
 qara'a قَرَا *qaraa*; bu'suN بُوْسٌ *busun*, 'ab'usuN أَبُوْسٌ *abusun*,  
 ra'ufa رَوْفٌ *raufa*, ru'asA' رُؤْسَاءُ *ruasau*; bi'ruN بِرٌّ *birun*,  
 'as'ilatun قَائِمٌ *asilatun*, ka'iba كَيْبٌ *kaiba*, qA'imun qَائِمٌ *qaimun*,  
 ri'AsaTuN رِئَاسَةٌ *riasatun*, su'ila سِيلٌ *suila*; samA'uN سَمَاءٌ *samau*,  
 barI'uN بَرِيَءٌ *bariun*, sU'uN سُوءٌ *suvun*, bad'uN بَدْءٌ *badun*,  
 ^say'uN شَيْءٌ *sayun*, ^say'iN شَيْءٌ *sayin*, ^say'aN شَيْئًا *sayan*;  
 sA'ala سَاءَلٌ *sala*, mas'alaTuN مَسَالَةٌ *masalatun*,  
 saw'aTuN سَوَّاْنٌ *sawatun*, \_ha.tI'aTuN حَطِيَّةٌ *hatiun*.

**Old Hamza convention:** In an older writing style that is used, e.g., in some Qur'an editions, the *hamza* is sometimes put below its carrier or on the connecting line. This style may be switched on by \oldhamza (and off again by \newhamza):

'as'ilatun قَائِمٌ *asilatun*, ka'iba كَيْبٌ *kaiba*, qA'imun qَائِمٌ *qaimun*,  
 su'ila سِيلٌ *suila*, ^say'aN شَيْئًا *sayan*, \_ha.tI'aTuN حَطِيَّةٌ *hatiun*.

**Madda** in the context 'ā is generated automatically:

'AkiluN أَكْلٌ *akilun*, qur'AnuN قُرْآنٌ *quranun*, ra'Ahu رَأْهُ *raahu*.

To reproduce the historic writing correctly, it can also be explicitly indicated by ^A, ^I, ^U in other contexts:

'a.sdiq^A'uh\_u أَصْدِقَوْهُ *asdiquuhu*;  
 ya^g^I'u يَحْيِي *yagihu*, s^U'ila سَوَّلٌ *sivila*.

**Sadda:** A double consonant must be written twice, even if it is coded by more than one character:

nazzala نَازَلَ nazzala, ba^s^sAruN بَشَّارٌ baššārun, nawwara نَوْرٌ nawwara,  
 sayyiduN سَيِّدٌ sayyidun, sa' 'AluN سَالٌ sa'ālun,  
 .sabiyyuN صَيْيٌ sabiyyun, 'aduwwuN عَدُوٌ aduwwun.

Instead of iyy, uw one can also write Iy, Uw:

.sabiIyuN صَيْيٌ sabīyun, 'adUwuN عَدُوٌ adūwun.

**Assimilation:** the definite article may be always written al-; a following “sun letter” must be written twice like in the Arabic spelling. The transliteration and the use of *sukūn* are adjusted accordingly:

'al-ddAru الْدَّارُ ad-dāru, 'al-rra^gulu الْرَّجُلُ ar-rağulu,  
 'al-ssanaTu الْسَّانُ as-sanatu, 'al-nnAru النَّارُ an-nāru;  
 'al-^gAru الْبَابُ al-ğāru, 'al-bAbu الْبَابُ al-bābu;  
 'al-laylaTu اللَّيْلَةُ al-laylatu, 'al-llisAnu اللَّسَانُ al-lisānu,  
 'al-ll\_ahu اللَّهُ al-lāhu.

The article may also be written in the assimilated form, with identical result:

'ad-dAru الْدَّارُ ad-dāru, 'ar-ra^gulu الْرَّجُلُ ar-rağulu,  
 'as-sanaTu الْسَّانُ as-sanatu, 'an-nAru النَّارُ an-nāru.

In some special cases the literal spelling must be used:

'alla\_dI الَّذِي alladī, 'alla\_dIna الَّذِينَ alladīna, 'allatI الَّتِي allati;

however:

'al-lla\_dAni الَّذِي al-ladāni, 'al-llatAni الَّتِي al-latāni,  
 'al-llawAtI الَّوَاتِي al-lawātī.

**Waṣla:** an auxiliary vowel at the beginning of a word is always written, but in the middle of a sentence generally without *hamza*. If a vowel precedes the word, the auxiliary vowel will be omitted in the transcription, and the *waṣla* sign will be used in the spelling:

wa-ismuHu وَاسْمُهُ wa-'smuhu, f--a-in.sarafa فَانْصَرَفَ fa-'nṣarafa.<sup>3</sup>

---

<sup>3</sup>In vowelized writing, it may sometimes be advisable to introduce a *kaṣīda* to prevent the vowel marks from bumping into each other.

This also works across word boundaries:

yA ibnI يَا آبِنِي ya 'bnā, h\_a\_dA ibnuh\_u هَذَا آبُهُ hādā 'bnuhū,  
qAla u\_hru^g قَالَ آخْرُجْ qāla 'hrug.

An auxiliary vowel at the end of the preceding word may be separated by a hyphen:

qad-i in.sarafa قَدْ آنَصَرَفَ qad-i 'nṣarafa,  
ra'aW-u al-bAba رَأَوْا الْبَابَ ra'aw-u 'l-bāba,  
min-i ibnih\_i مِنْ آئِنَّهِ min-i 'bnihā.

This also works for the article preceding 'alif al-waṣl:

'al-i-ismu الْإِنْسُمُ 'al-i-'smu, 'al-i-i^stirA'u الْأَشْتَرَاءُ 'al-i- 'stirā'u,

and even if the auxiliary vowel is omitted in the spelling:

ra^guluN-i ibnatuh\_u ^gamIlaTuN رَجُلُ آبَتَهُ حَيْلَةً rağulun-i 'bnatuhū  
ğamılılatun,  
mu.hammaduN-i al-qura^sIyu مُحَمَّدُ الْقُرْشِيُّ muhammadun-i 'l-quraşīyu.

**The particles *li-* and *la-*** must be combined with the article except before *lām*:

lil-rra^guli لِلَّرَجُلِ lir-rağuli, lal-ma^gdu لِلْمَجْدُ lal-mağdu;

however:

li-llaylaTi لِلَّيْلَةِ li-laylati, li-ll\_ahi لِلَّهِ li-lāhi.

**The Name of God** is written with a special ligature if it is recognized from the input sequence *ll\_ah*:

'al-ll\_ahu أَللَّهُ 'al-lāhu, ta-al-ll\_ahi تَالَّهِ ta-'l-lāhi.

**Increased spacing (*Tatwīl*)** between adjoining characters may be produced by a double hyphen --;

qabila قَبْلَ qabila, qa--bi--la قَبْلَ qabila, q--ab--ila قَبْلَ qabila.

q--a--b--i--la قَبْلَ qabila, qa----bi----la قَبْلَ qabila

This feature should be used with discretion; automatic spreading usually leads to a better result.

**Ties between words** are indicated by a single hyphen:

bi-baladiN بِلَادِي bi-baladin, ta-al-ll\_ahi تَالَّهِ ta-'l-lāhi,

sa-ya'tI سِيَاطِي sa-yatī, li-yafra.ha لِيَفْرَحَ li-yafraha,

wa-iswadda وَسْوَدَّ wa-'swadda, ba'da-mā بَعْدَمَا ba'da-mā,  
.tAla-mā طَالَمَا tāla-mā, fī-ma فِيمَا 'alā-ma عَلَمَا alā-ma.

A single hyphen at the beginning or end of a word will enforce the use of the joining form of the first resp. the last character, if that form exists (for special uses only):

s س s,	-s س -s,	-s- س -s-,	s- س s-
h ه h,	-h ه -h,	-h- ه -h-,	h- ه h-
d د d,	-d د -d,	lā لā lā,	-lā ل -lā
1400 h- ه ١٤٠٠	1400 h-		

Digit sequences are written in the natural order:

1234567890 ١٢٣٤٥٦٧٨٩ 1234567890

Hyphen and comma as a decimal separator do not terminate the number:

123-456,789 ١٢٣-٤٥٦,٧٨٩ 123-456,789

Ligatures are generated automatically; they can be suppressed by |:

'al-'islAmu الْإِسْلَامُ al-'islāmu;  
'al-'gArū الْجَارُ al-'gāru, 'al|^gArū الْجَارُ algāru;  
\_tumma تُمَّة tumma, \_tu|mma تُمَّة tumma;  
mu.hammaduN مُحَمَّدٌ muhammaduN, mu|.ha|mmaduN مُحَمَّدٌ muhammadun.

Abbreviations and emphasis are indicated by \emphasize or \emph:

\emphasize {sl'm} صَلَمٌ sl'm  
\emphasize {ab\,^g} اب ج ab\,^g  
\emph {'alayhi as-salAmu} عَلَيْهِ السَّلَامُ alayhi 's-salāmu

## 4.2 Verbatim input

After disabling language specific processing by \setverb, ArabTeX will not use any context information to determine the carrier of *hamza*. Instead the user has to supply this information herself by the next character typed after <'>. Generally this character will be used as the carrier; for examples and some exceptions see Table 4.3. A short vowel indicator may follow.

To ease automatic conversion, an initial '*alif* may also be coded <A>.

'a	أ	<i>hamza on 'alif</i>	'i	إ	<i>hamza below 'alif</i>
'w	ؤ	<i>hamza on wāw</i>	'y	ئ	<i>hamza on a tooth</i>
'h	هـ	<i>hamza on hā'</i>	'B	ءـ	<i>hamza on the line</i>
'I	ءـ	<i>isolated hamza</i>	'A	ءـ	<i>madda on 'alif</i>

Table 4.3: Verbatim encodings for the carrier of *hamza*

### 4.3 Alternate input encodings

The ArabTEX input notation has been very carefully designed for flexibility, readability, and ease of use for linguists confined to standard 7-bit ASCII equipment for processing and transmitting data. However, it does not make much sense re-coding existing machine-readable text files that have been encoded according to other standards. Thus, some alternate reading modules have been written and a general code switching procedure has been provided.

An alternate reading module, e.g. `asmo449.sty` for the ASMO 449 code, is installed by `\usepackage{asmo449}` or by `\input asmo449.sty`. Afterwards, a *code\_name* (in this case `asmo449`) is defined. Input encoding is switched by the command `\setcode{code_name}` that changes the coding for *Arabic text* globally. Encoding may be switched several times in the same document, provided the appropriate reading modules are installed; `\setcode{arabtex}` or `\setcode{standard}` reverts to the standard ArabTeX notation.

Texts coded in an alternate encoding are always rendered verbatim, therefore \novocalize, \vocalize, \fullvocalize and the language selection commands like \setarab etc. generally make no sense and are temporarily disabled.

#### 4.3.1 ASMO 449 = ISO 9036

ASMO 449 (see Table 4.4) is a 7-bit code, differing from ASCII (ISO 646) mainly by replacing the Roman letters by the Arabic letter characters and diacritical marks; the Arabic digits share their positions with the ASCII digits. The positions of special and control characters in both codes are identical. ASMO 449 is supported by Arabic MS-DOS.

The file `asmo449.sty` contains a reading module for the ASMO 449 code (identical to ISO 9036). It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage {asmo449}` or by `\input asmo449.sty`. The module is activated by `\setcode {asmo449}` or `\setcode {iso9036}`; all following Arabic text will be considered to be coded according to the ASMO 449 standard.

	0	1	2	3	4	5	6	7
00	NUL	DLE	SP	ء	ا	ذ	-	ـ
01	SOH	DC1	!	۱	ء	ر	ف	ڻ
02	STX	DC2	"	۲	آ	ز	ق	ڦ
03	ETX	DC3	#	۳	أ	س	ك	ڻ
04	EOT	DC4	\$	؍	ؤ	ش	ل	ڻ
05	ENQ	NAK	%	؅	إ	ص	م	ڻ
06	ACK	SYN	&	؆	ئ	ض	ن	ڻ
07	BEL	ETB	,	؇	ا	ط	ه	ڻ
08	BS	CAN	)	؈	ب	ظ	و	ڻ
09	HT	EM	(	؉	ة	ع	ى	
10	LF	SUB	*	:	ت	غ	ي	
11	VT	ESC	+	؊	ث	]	ڻ	}
12	FF	IS4	'	>	ج	\	ـ	
13	CR	IS3	-	=	ح	[	ـ	{
14	SO	IS2	.	<	خ	~	ـ	~
15	SI	IS1	/	؟	د	-	ـ	DEL

Table 4.4: ASMO 449 code table

Texts in ASMO 449 are usually not fully vowelized; thus the transliteration cannot be expected to be correct. This is especially true for Egyptian texts which commonly do not differentiate between *yā'* and *'alif maqsūra*.

A minimal driver file for processing existing ASMO 449 text, e.g. in a file `asmotext.dat`, could look as follows:

```
\documentclass {article}
\usepackage{arabtex}
\usepackage{asmo449}
\begin{document}
\setcode {asmo449}
\begin{RLtext}

\input asmotext.dat

\end{RLtext}
\end{document}
```

### 4.3.2 ASMO 449E = ISO 8859-6, MacOS Arabic

The file `iso88596.sty` contains a reading module for the ISO 8859-6 code (extended ASMO 449 = ASMO 449E). It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage{iso88596}` or by `\input iso88596.sty`. The module is activated by `\setcode{iso8859-6}`; all following Arabic text will be considered to be coded according to the ISO 8859-6 standard. The ArabT<sub>E</sub>X notation may be reactivated by `\setcode{arabtex}`.

ISO 8859-6 (see Table 4.5) is an 8-bit code closely related both to 7-bit ASCII and to ASMO 449; whereas the lower 128 positions are identical to ASCII (ISO 646), the upper 128 positions contain the Arabic characters of ASMO 449 in the analogous places.

This code, plus additional Persian, Urdu, graphic, and control characters, is supported by *MacOS* in Arabic mode.

The notes on vowelization and transliteration of ASMO 449 apply also.

The driver file indicated for ASMO 449 will be usable after the obvious modifications; however, your T<sub>E</sub>X installation must be capable of processing 8-bit data input. This is nowadays usually the case; otherwise you could try to locally find some utility program that will strip the highest order bit off the characters in your file, and process the result via ASMO 449.

Table 4.6: Windows CP1256 code table

### 4.3.3 CP 1256 = Arabic Windows Encoding

The file `cp1256.sty` contains a reading module for the Arabic part of the code page CP1256 used within *MS Arabic Windows*. It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage{cp1256}` or by `\input cp1256.sty`. The module is activated by `\setcode{arabwin}` or `\setcode{cp1256}`; all following Arabic text will be considered to be coded according to the *MS Arabic Windows* standard. The ArabTeX notation may be reactivated by `\setcode{arabtex}`.

The code page 1256 used in *MS Arabic Windows* (see Table 4.6) is an 8-bit code closely related to 7-bit ASCII; whereas the lower 128 positions are identical to ASCII (ISO 646), some of the upper 128 positions contain the Arabic characters plus additional Persian, Urdu, graphic, and control characters.

The notes on vowelization and transliteration of ASMO 449 apply also.

### 4.3.4 UNICODE Arabic

The file `utf8.sty` contains a reading module for the Arabic and the Hebrew segment of UNICODE in UTF-8 encoding. It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage{utf8}` or by `\input utf8.sty`.

UTF-8 (UNICODE Transmission Format, see tables 4.7, 4.8, and 7.4) is a multi-byte encoding which, for Arabic and Hebrew, uses two bytes per character whereas ASCII characters use a single byte. Far-eastern languages are encoded in three bytes per character. This is in contrast to UNICODE itself which always uses two bytes per character.

The module is activated by `\setcode{utf8}`; all following Arabic and Hebrew text will be considered to be coded according to the UTF-8 encoding standard. To use the correct font, select the appropriate language. The ArabTeX notation may be reactivated by `\setcode{arabtex}`.

### 4.3.5 ISIRI 3342

The file `isiri.sty` contains a reading module for the ISIRI 3342 Persian Standard Code. It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage{isiri}` or by `\input isiri.sty`. The module is activated by `\setcode{isiri}`; all following Arabic text will be considered to be coded according to the ISIRI 3342 standard. The ArabTeX notation may be reactivated by `\setcode{arabtex}`.

The ISIRI 3342 code (see Table 4.9) is an 8-bit code closely related to 7-bit ASCII; whereas the lower 128 positions are identical to ASCII (ISO 646), some of the upper 128 positions contain the Arabic/Persian characters plus additional graphic and control characters.

The notes on vowelization and transliteration of ASMO 449 apply also.

Table 4.9: ISIRI 3342 code table

### 4.3.6 Buckwalter Transliteration

\*

The file `buck.sty` contains a reading module for the transliteration devised by the lexicographer Tim Buckwalter. It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage{buck}` or by `\input buck.sty`.

The Buckwalter System (see Table 4.10) is a 7-bit encoding, reusing the Roman letters and the special characters for encoding Arabic letters and diacritical marks; the Arabic digits share their positions with the ASCII digits.

Text coded in ASMO449 or ISO-8859-6 can be converted trivially and unambiguously into the Buckwalter transliteration; and except for the rarely used dagger 'alif and wasla-on- 'alif, which are missing from ASMO449 and ISO-8859-6, the reverse mapping is equally straightforward. Buckwalter transliteration can be trivially converted to and from UNICODE, which contains the extra characters.

The Buckwalter System is a true or strict *orthographical* transliteration, as opposed to the majority of “transcription” romanizations of Arabic that are intended to convey *phonological* or morphophonological information; it has the advantages of being complete, typable and displayable on common ASCII terminals and printers. Because the Roman character equivalents are chosen to be reasonably mnemonic, Arabists can learn to read and write Buckwalter texts with little difficulty.

The Buckwalter convention is activated by `\setcode{buck}`. Since it preempts the curly braces { and }, as well as the angle braces < and >, for encoding purposes, short *Arabic insertions* must be denoted specially, as arguments of the command `TB( )` (with *round* parentheses!) On the other hand, *Arabic environments* work as expected.

Table 4.10: Buckwalter transliteration

# Chapter 5

## Transliteration

In addition to the arabic writing, the standard scientific transliteration may also be obtained from a fully vowelized input text. This mode is activated by `\transtrue` and may be switched off again by `\transfalse`.<sup>1</sup> If *only* the transliteration is wanted, you can deactivate the arabic writing by `\arabfalse`; it can be reactivated by `\arabtrue`. If both modes are active their output will be interleaved line by line. The font used for the transliteration is normally *italic*, it can be changed globally by `\settransfont{font}`.

### 5.1 ZDMG transliteration style

The “ZDMG transliteration” is in fact a family of closely related, but slightly different, transliteration conventions for several languages using the Perso-Arabic script. Therefore for producing it correctly, the appropriate language mode must have been selected.

For Arabic text, the following special cases are handled:

- after the definite article, a double consonant will be assimilated;
- an initial vowel will be replaced by an apostrophe whenever the preceding word ended with a vowel (in this case a *wasla* appears in the Arabic writing). If that is not wanted, start with *hamza*.
- a silent *'alif* or *'alif maqṣūra* after `<N>` (*tanwīn*) and `<U>` is omitted in the transliteration. The same happens after *wāw* if it is written as a capital `<W>`.
- To correctly reproduce some historical writings, a silent long vowel after `<_a>` is omitted in the transliteration. For examples, see section 4.1.5.

---

<sup>1</sup>The former option “*atrans*” is no more necessary.

For Persian texts, the Izafet connection is handled specially, and a final silent *h* will be omitted in the transliteration.

## 5.2 Other transliteration styles

Since there is no general agreement on transcriptions, a number of variants have been provided:

- `\settrans{standard}` or `\settrans{zdmg}` is the default ZDMG mode.
- `\settrans{english}` will switch to the style of the Encyclopedia of Islam which is close to the conventions of the Library of Congress.
- `\settrans{iranica}` will produce the style used in the Encyclopedia Iranica.
- `\settrans{farsi}` produces a variant of the style used in the Encyclopedia Iranica.
- `\settrans{lazard}` switches to the conventions of Gilbert Lazard: “La langue des plus anciens documents de la prose persane”.
- `\settrans{urdu}` switches to the conventions for Urdu used in the ALA-LC tables.
- `\settrans{kashmiri}` switches to the conventions for Kashmiri used in the ALA-LC tables; this mode is also chosen automatically by `\setkashmiri`.
- `\settrans{turk}` will produce a style similar to modern Turkish; it only makes sense for Ottoman texts.
- Transcription conventions for Hebrew are given in section 7.7.

The transliteration mode may be switched globally at any time. If the input text is not fully vowelized, the transcription cannot be expected to be correct.

## 5.3 Capitalization

If transcription output is used as part of a Roman text, it may be desirable to have some words start with a capital letter. This can be achieved by prefixing the command `\cap` to the word in question. If the first letter is *hamza* or ‘*ayn*’, the next letter will be capitalized. This feature may also be used after the article or a prefix, and even in other arbitrary positions; `\cap` will only influence the following letter. The Arabic writing is not affected.

## Chapter 6

# Support for other languages using Perso-Arabic script

ArabTeX is primarily intended for typesetting texts in classical and modern Arabic, but it also provides some support for several other languages that are customarily written using the Arabic alphabet or some extension of it.

In order to switch to the conventions for one of these languages, say `\setfarsi`, `\seturdu`, `\setpashto`, `\setmaghribi`, etc.; `\setverb` will switch off any language specific processing. `\setarab` can be used to switch back to the Arabic conventions.

After selecting the language, `<` and `>` are active as delimiters for quotations; `\setnone` will return `<` and `>` to their normal TeX meaning. Quotations still can be bracketed by `\<` and `\>` or by using `\RL{ }{ }`.

This part of ArabTeX relies heavily on contributions from the user community; we want to especially mention Ivan Derzhanski who completely reimplemented the routines for processing Persian, and Anshuman Pandey for the Urdu part. As we extensively modified these contributions again while integrating the system, we are solely responsible for any remaining, or newly introduced, errors.

### 6.1 Persian (Farsi, Dari)

The Persian mode is activated by `\setfarsi`.

- All characters needed for writing Farsi are available by default. The short vowels `<e>` and `<o>` are mapped to `<i>` and `<u>`, the long vowels `<E>` and `<O>` to `<I>` and `<U>` without a vowel indicator. `<H>` denotes final silent *hā'*. This *hā'* receives no *sukūn* even in fully vowelized mode.

- For *fatha* or *kasra* followed by a final silent *hā'* you can also write <,a> or <,e> in place of <aH> and <eH> (deprecated).
- The *izāfet* connection may always be written <-i> or <-e> (with hyphen); then ArabTeX tries to determine the correct spelling from the context. Likewise the *yā'-i-wahdat* can always be written <-I> or <-E>.
- The present tense forms of the copula are coded <-am>, <-I>, <-ast>, <-Im>, <-Id>, <-and>. In the output they are written as separate words after a little space.
- The final *yā'* carries no dots. Farsi uses the Nasta'liq font when available, otherwise Naskh.

### 6.1.1 Coding examples for Persian<sup>1</sup>

The short vowels *a* (*ă*), *e* (*ĭ*), *o* (*ű*) are denoted by the lowercase letters a, e or i, o or u:

bar بَر bar, beh بَه beh, bon بُن bon.

The long vowels *a* (*ā*), *i* (*ī*, *ē*), *u* (*ū*, *ō*) are denoted by the capital letters A, I or E, U or O. *Ælef mædde* is automatically generated for word-initial a:

Ab بَل ab, bAd بَدَ bād, bId بَدَد bīd, bUd بُدَد būd.

Note that I yields a *ya-ye mæ'ruf* (with *zīr*), whilst E yields a *ya-ye mæjhul* (without *zīr*). Similarly, U yields a *waw-e mæ'ruf* (with *piš*), whilst O yields a *waw-e mæjhul* (without *piš*):

tIr تِير tīr, tE.g تِيغ tēg; dUr دُور dūr, zOr زُور zōr.

The diphthongs *ei* and *ou* are written ay and aw:

pay پَيٰ pay, naw نَوٰ naw.

Intervocalic *hæmze* is written ':

pA'Iz پَائِيز pāīz; miyA'I میَائِی miyāī, mIgU'I میگوئِی miḡūī;

tawAnA'I تَواَنَائِی tawānāī, zanA^sU'I زَنَشُوئِی zanāshūī.

Silent word-final *wāw* is generated by \_U or O:

t\_U توُ tu, d\_U دُ du; t\_O توُ tō, d\_O دُ dō.

---

<sup>1</sup>We gratefully acknowledge the voluntary help by Ivan Derzhanski who wrote this chapter, and implemented the language-specific processing. As we extensively modified his routines during system integration, all responsibility for any remaining, or new, errors rests with us.

**Waw-e mæ‘dul** is written w; it is omitted in the transliteration and the preceding xe receives no jæzm:

\_hwAb خواب *hāb*, \_hwI^s خویش *hīsh*, \_hwod خود *hod*.

**Ha-ye hæwwæz-e mæxfi** is generated by H, or optionally by ,e, ,a or ,A (the latter forms are deprecated). It does not receive a jæzm even in fully vocalised mode and is not joined to a following letter:

\_hAneH حانه *hāneh*, ^c,e چه *čeh*, naH هه *nah*,

yal\_aH يله *yalāh*, yal,A يله *yalāh*

\_hAneHhA حانهها *hānehhā*, \_hAneH-hA حانهها *hāneh-hā*.

**Short edafe** is written -e or -i:

ketAb-e U كتاب او *ketāb-e ī*, rAh-e t\_U راه تو *rāh-e tu*,

nAmeH-i man نامه من *nāmeh-i man*,

bInI-e An mard بینی آن مرد *bīnī-e ān mard*,

pA-i In zan پای این زن *pā-i īn zan*,

bAzU-i In zan بازوی این زن *bāzū-i īn zan*.

**Long edafe** is written -\_i:

dAr-\_i man دار من *dār-ī man*, \_hU-\_i t\_U خوي تو *hū-ī tu*.

**Hæmze** as *ya-ye wæhdæt/nesbæt/xetab* is likewise written -\_i:

nAmeH-\_i نامه *nāmeh-ī*, sormeH-\_i سرمه *sormeh-ī*,

gofteH-\_i گفته *gofteh-ī*.

**Ye-ye wæhdæt** is written -I or -E:

ketAb-I نامه اي *ketāb-ī*, rAh-I راهي *rāh-ī*, nAmeH-I نامه *nāmeh-ī*;

dAnA-I داناي *dānā-ī*, pArU-I پاروي *pāru-ī*;

dAnA-I-keh دانائيكه *dānā-ī-keh*, pArU-I-keh پارويكه *pāru-ī-keh*.

The present tense forms of the verb *budæn* and the pronominal clitics are written as they are spoken:

rafteH-am رفته ام *rafteh-am*, rafteH-Im رفته ايم *rafteh-īm*,

rafteH-I رفته اي *rafteh-ī*, rafteH-ID رفته اي *rafteh-īd*,

rafteH-ast رفته اشت *rafteh-ast*, rafteH-and رفته اند *rafteh-and*;

mard-Id مَرْدِيدْ *mard-īd*, asb-etAn أَشْتَانْ *asb-ētān*;  
 An^gA-st آنْجَاسْتُ *ānğā-st*, U-st أُوشتُ *ū-st*, t\_U-st تُوشتُ *tu-st*;  
 ketAb-I-st كِتَابِيَسْتُ *ketāb-ī-st*, nAmeH-I-st نَامِهِ إِيَسْتُ *nāmeh-ī-st*.

The preposition *be-* can be written with or without a hyphen:

be-man بَعْنَ *be-man*, be-t\_U بِشُو *be-tu*;  
 be-An بِإِنْ *be-ān*, be-In بِإِيْنْ *be-īn*, beU بِأُو *beū*.

The components of compounds can be separated by \,, or " | ":

.sA.heb\,\_hAneH صَاحِبْ خَانِهِ *sāhebħāneh*,  
 ta\_ht-e-'' | \_hwAb تَحْفَتْ خَوَابْ *tahf-e-hab*;  
 pas\\_,andAz پَسْ آنْدَازْ *pasandāz*, naw" | AmUz نَوْ آمُوزْ *nawāmūz*,  
 bI\\_,\_hwod بِ حُودْ *bīḥud*.

Digit sequences are written in their natural order:

1234567890 ۱۲۳۴۵۶۷۸۹۰ • 1234567890

## 6.2 Maghribi

This works nearly like Arabic, but using a different writing convention. *fā'* is written with one dot below the letter, *qāf* with one dot above the normal letter form of *fā'*. The three dots of *vā'* are put below the letter.

Switch to this mode by \setmaghribi.

## 6.3 Urdu

The Urdu mode is activated by \seturdu.

- For Urdu, additional codings are available, see Table 6.1. Some of the given codings also occur in Pashto but with a different meaning, see Section 6.4.
- Even in fully vowelized mode, an aspirated consonant before <h> receives no *sukūn* since the two are technically a single letter.
- Urdu uses the Nasta'liq font when available, otherwise Naskh.

### 6.3.1 Coding examples for Urdu<sup>2</sup>

The short vowels *ă*, *i*, and *ü* are encoded by the lowercase letters **a**, **i**, and **u**, and are marked respectively by *zabar*, *zēr*, and *pēš*:

par پار par , dam دم dam / fir فر fir , din دن din /  
sukh سکھ sukh , dukh دکھ dukh

The long vowels *ā*, *ī*, *ū*, *ē*, and *ō* are encoded by the capital letters **A**, **I**, **U**, **E**, and **O**:

Note: 'alif madda is automatically generated for word-initial *ā*:

Ap آپ āp / Am آم ām  
tIn تین tīn , la,rkI لڑکی laṛkī / dUr دور dūr / dEr دیر dēr ,  
ba,rE بارے barē / mOr مور mōr

Note: I yields a *ya-ye ma'ruf* (with *zēr*), while E yields a *ya-ye ma'ghul* (without *zēr*).

tIn tīn , rItI ریتی rītī / mErE میرے mērē , la,rkE لڑکے larķē

The diphthongs *ae* and *ao* are encoded **ae**, and **ao**:

kaesA کیسا kaesā / paodA پوڈا paodā

Note: U yields a *wāw-e-ma'ruf* (with *pēš*), while O yields a *wāw-e-ma'ghul* (without *pēš*), and ao is indicated by a *zabar*. Compare:

pUr پور pūr / pOtA پوتا pōtā / paodA پوڈا paodā

Intervocalic *hamza* is written ':

'cA'E چائے cā'ē / ma'I مئی maī / kO'I کوئی kōī

**Aspiration** is produced by coding a **h** after the consonant to be aspirated.

Aspiration in Urdu is produced by adding *dō čašmī he* after the consonant:

khEt کہیت khēt / ghar گھر ghar / mujhE محجہ mujhē / dharm دھرم dharm

**Nasalization** is indicated by *nūn-e-junnah* coded as **.n**. Note that the *nuqta* for *nūn* is not written when it is used to represent nasalization:

mae.n میں maen / a,hi.nsA ایسا ahinsā

---

<sup>2</sup>Please contact Anshuman Pandey [[apandey@u.washington.edu](mailto:apandey@u.washington.edu)] with questions or comments regarding this section.

Table 6.1: The Urdu Alphabet

The “*hanging he*” or *Ha-ye hawwaz-e-mahfi* is generated by H. It does not receive a *jazm* even in fully vocalised mode and is not joined to a following letter: rAjaH راجھ / kiH کی h / naH نا h / waH وہ wah / nAmaH ناما h / yaH یہ yah

*Tanwīn* is coded by aN:

taqrIbaN تقریباً taqriban / faoran فوراً faoran

*Tašdīd* is produced by coding the consonant twice:

mi,t,tI میٰتی / unnis اُنیس unnis

Note: Double consonants in Urdū verbs are written without *tašdīd*. *Tašdīd* is disabled by inserting | between the double consonants:

ban|nA بَنَّا / gin|nA گِنَّا ginnā / jAn|nA جَانَّا ġānnā

*Idāfat* is written -e or -i:

^sEr-e panjAb شیر پنجاب šer-e panğāb

Ab-e .hayAt آب حیات āb-e hayāt

*Wāw-e ma'dūla*, or the “*wāw* which is passed over”, is written w; it is omitted in the transliteration and the preceding *he* receives no *jazm*:

\_hwAb خواب hāb / \_hwAja خواجہ hāğa / \_hwud خود hud

*Wāw-e 'atf*, or the “*wāw* of conjunction” is coded as -0

gul-0 bulbul گلو بُلبُل gul-ō bulbul

sarw-0 sanōbar سرو و سنوبَر sarw-ō sanōbar

tar-0 tāzah تَزَاهَ tar-ō tāzah

'Alif *maqsūra* is encoded as \_A or Y:

fatw\_A فتوی fatwā / da'wY دعویٰ da'wā

**Digit sequences** are written in the natural order:

0123456789 • ۱۲۳۴۵۶۷۸۹ 0123456789

## 6.4 Pashto (Afghanic)

,t	ټ	́	<i>tā'</i> with a small loop

ee	ئے	ey	the diphthong <i>ey</i>
E	ئے	ē	the long vowel <i>ē</i>
O	ئے	ō	the long vowel <i>ō</i>
U	ئے	ū	the long vowel <i>ū</i>

Table 6.2: Additional codings for Pashto.

Switch to this mode by `\setpashto`. For writing some Pashto words in the Urdu style, write the command `\seturdu` and afterwards switch back.

- For Pashto, additional codings are available, see Table 6.2. Some of the given codings also occur in Urdu but with a different meaning.
- The codings `<H>`, `<,a>` and `<,e>` are used as in Persian. The rules for *izāfet* and *yā'-i-wahdat* apply.
- The short vowel `<e>` is indicated by a *zwarakay*, `<o>` by an inverted *damma*.

a	ا	a	^n	ج	n̄	z	ڇ	z	kh	ڪ	kh

Table 6.3: The Sindhi Alphabet

## 6.5 Sindhi

To activate the Sindhi mode, select the language by `\setsindhi`. Sindhi input texts are encoded in a modification of the standard ArabTeX encoding. The alphabet is given in Table 6.3.

- Use hyphens to resolve ambiguities with aspirated consonants.
- There are two special codings: `<.mIN>` or `\MIN: ئ`, `<'|IN>` or `\IN: ئ`.
- The user might want to break some ligatures by inserting a vertical bar to get the correct writing, or just for a better appearance of the script.

Table 6.4: The Kashmiri Alphabet

## 6.6 Kashmiri

Select Kashmiri by \setkashmiri. The input codes are given in Table 6.4. The transcription follows the ALA-LC romanization conventions.

## 6.7 Uighuric

Switch to this mode by \setuighur.

Uighuric input texts are encoded in a modification of the standard ArabTEX encoding, see column 5 of Table 6.5. Please observe that in Uighuric all characters are coded verbatim.

	1    2    3    4 = 5 ( 6 ) 7		1    2    3    4 = 5 ( 6 ) 7

Table 6.5: ArabTeX encoding of Uighuric

## 6.8 Old Malay

The preliminary ArabTeX language mode `\setmalay` is provided for processing Old Malay texts in the extended Arabic writing.

Old Malay (Jawi) input texts are encoded in a modification of the standard ArabTeX encoding, see below.

Additional encodings:

p	ڦ	ng	ڻ
g	ڦ	ny	ڻ
v	ڻ	c	ڇ

This language mode is strictly experimental and expected to contain many errors; it will be adapted to the users' requirements. Please report your experience and suggestions for changes and improvements to the author.

## 6.9 Other extensions of the Perso-Arabic script

This is up to experimentation by the user. If `\setarab` or `\setfarsi` will not produce the desired result, try `\setverb` for verbatim mode.

The vowelization and the transliteration cannot generally be expected to be correct, but might work by accident.

In case some character variants not yet provided are needed, feel free to ask the author for help. There is no simple way for the user to modify the script directly.

# Chapter 7

## Hebrew mode

On the request of some users, starting with Version 3.02 ArabTEX has been extended by some modules adding support for Hebrew. Whereas the initial applications only called for short Hebrew quotations within Roman texts, possibly containing Arabic insertions too, adding “Hebrew environments” proved comparatively easy. We also added most commands provided by the HebrewTEX package (an alternative T<sub>E</sub>X extension developed in Israel, that requires T<sub>E</sub>X--X<sub>E</sub>T). The Hebrew date quite probably will *not* work correctly.

To process Hebrew input with ArabTEX, proceed as follows:

- for use with Plain T<sub>E</sub>X, say `\input hebtex`; a small loader module will load both ArabTEX *and* the Hebrew extension.
- with L<sub>A</sub>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> say: `\usepackage{hebtex}`.

The extension provides a language mode `\sethebrew`, and several common encodings of texts in Hebrew, that may be switched by the `\setcode` command. One (nameless) encoding is compatible with Dov Grobgeld’s editor HED, so files prepared for HebrewTEX are supposed to be compatible. In addition, the standard ArabTEX encoding has been adapted to cater for Hebrew too.

### 7.1 Language switching

`\sethebrew` switches to Hebrew mode, `\setarab` back to Arabic.

Remember to switch the encoding and the vowelization mode too!

## 7.2 Standard Hebrew encoding

`\setcode{standard}` or `\setcode{arabtex}` will switch to the standard ArabTeX Hebrew encoding, defining the consonants as follows:

,	אֵلָה	aleph	בָּ	בֵּت	beth	גָּ	גֵּي	gimel	d	דְּלֵת	daleth
h	הֵה	heh	וָ	וֵי	waw	זָ	זֵי	zayin	_h	חֵת	chet
t	תֵּת	teth	יָ	יֵוּ	yod	קָ	קֵעַ	kaph	l	לֵמֶד	lamed
m	מֵם	mem	נָ	נֵן	nun	סָ	סֵדֶךְ	samekh	'	אֵין	ayin
p	פֵּה	peh	.סָ	סֵאָה	sade	קָ	קֵרֶבֶת	qof	r	רֵשֶׁת	resh
,s	שֵׁין	sin	ׁסָ	ׁשֵׁין	shin	ׁסָ	ׁשֵׁין	s(h)in	t	תֵּאוֹן	taw

Soft consonants are marked by *raphe*: <v> for ڻ, <f> for ڻ.

Vowels are encoded as follows:

short vowels		long vowels			defective			half vowels		
a	אָ	patach	A	אֹ	qames			.a	אַ	chateph patach
e	אֵ	segol	E	אֵּ	sere yod	_e	אֶ	.e	אַּ	chateph segol
i	אֵֿ	chireq	I	אֵּֿ	chireq yod			.i	אִֿ	shewa
o	אַֿ	qames chatuph	O	אַּֿ	cholem waw	_o	אַַֿ	.o	אַַּֿ	chateph qames
u	אַֿֿ	qibbus	U	אַּֿֿ	shureq			.u	אַַֿֿ	no vowel mark

The *matres lectionis* can also be written explicitly, e.g., <\_ey> or <E> for '□, <iy> or <I> for '□, <\_ow> or <O> for '□.

- `\vocalize` (default) activates vowel points and special punctuation; `\novocalize` switches them off again.
  - *patach furtivum* is written `<.a>` before its carrier: `<rU.a_h>` gives רִאָה.
  - *dagesh lene* with `<b g d k p t>` is expressed by prefixing a dot: `<.b>` בּ, `<.g>` גּ, `<.d>` דּ, `<.k>` קּ, `<.p>` פּ, `<.t>` טּ; the same device is used for *mappiq* with `<h>`: `<.h>` הּ.
  - *dagesh forte* and likewise *dagesh orthophonicum* are expressed by doubling the consonant; thus two equal consonants in sequence (even in

\novocalize mode) must be separated by some short vowel indicator (or <.u>), if the standard encoding is used.

- *meteg* is indicated by <|> after the vowel.
- *maqqef* is <--> (en-dash; a single hyphen will be ignored)
- Prefixes may be separated by a single hyphen, which appears in the transcription without changing the Hebrew writing.
- For those rare cases where a consonant is missing, input <| "> (bar quote) or <N> to produce a small space; this may also carry vowels.
- Accents and cantillation marks are not supported.
- For special applications, as in the table above, the input encoding <M> will produce a box □ which may carry vowels; the L<sup>A</sup>T<sub>E</sub>X package `latexsym` is required to show the box.
- Abbreviations are marked by \abbr.

## 7.3 ISO 8859-8 and Hebrew MS-Windows

ISO 8859-8 is an 8-bit encoding extending 7-bit ASCII with Hebrew letters. Within Hebrew MS-Windows, the code page CP 1255 provides a superset of ISO 8859-8, containing a full complement of Hebrew vowels, and a host of miscellaneous special characters.

ArabTeX provides within the package `cp1255.sty` a reading module for a subset of CP1255, containing all Hebrew characters from ISO 8859-8 and all Hebrew vowels of CP1255, but omitting the extra special characters (see Table 7.1). This encoding is activated by the switching command `\setcode{cp1255}` or `\setcode{hwin}`.

## 7.4 HebrewT<sub>E</sub>X “oldcode” and “newcode”

There is a default reading module for the Hebrew characters in code positions 96 ··· 122 (HebrewT<sub>E</sub>X “pccode”), in code positions 128 ··· 154 as generated by the editor HED, and also in code positions 224 ··· 250 (HebrewT<sub>E</sub>X “newcode”, ISO 8859-8). In fact these are three different encodings catered for by a single reading module; see the code assignments in Table 7.3. Observe that the Hebrew characters in ISO 8859-8 are supported both by this reading module and by the Hebrew MS-Windows encoding mentioned in Section 7.3. The code switching commands `\setcode{hed}`, `\setcode{newcode}`, `\setcode{pccode}`, and `\setcode{iso8859-8}` all activate the default reading module.

Table 7.3: HebrewTeX, CP 1255 and ISO 8859-8 code table

In this encoding vowel points, *dagesh* and *meteg* cannot be used, as they cannot be represented in the input. Abbreviations may be expressed by a single or double apostrophe (right quote). The final and the medial forms of characters are equivalent; ArabTeX will choose the appropriate shape automatically.

## 7.5 BHS encodings

a"MT"b"001"c"Gen"x1

1<sup>1</sup> בְּרָאשִׁית בָּרָא אֱלֹהִים אֶת הַשְׁמִים וְאֶת הָאָרֶץ: <sup>2</sup> וְהָאָרֶץ הַיְתָה

וְלִימִים וְשָׁנִים:

Figure 7.1: BHS Hebrew example

The package `bhs.sty` provides support for the encoding that is used in the machine-readable version of BHS (Biblia Hebraica Stuttgartensia). After loading the package, you can switch to this encoding by the command `\setcode{bhs}`. The *patach furtivum* is not coded explicitly in BHS; ArabTeX tries to guess it. For an example, see Figure 7.1.

BHS line numbers and comments are only partially supported. The line-breaks of the source are ignored. To respect them set `\bhsmode=2` or `\bhsmode=1`; adjusting `\textwidth` might be necessary.

`\setcode{witbhs}` switches to a variant of the BHS encoding that was developed by the Werkgroep Informatica of the Vrije Universiteit Amsterdam. Activate it by `\usepackage{witbhs}`. We have slightly extended the latter encoding for special purposes: `<=>` after a consonant forces the use of its medial shape unconditionally, even at the end of a word; `<+>` produces a small space that may carry vowel points, and `<$>` shows as a box that may carry vowel points. To use this feature, the L<sup>A</sup>T<sub>E</sub>X package `latexsym` is required.

## 7.6 UNICODE Hebrew

The file `utf8.sty` contains a reading module for the Arabic and the Hebrew segment of UNICODE in UTF-8 encoding. It is installed by the L<sup>A</sup>T<sub>E</sub>X command `\usepackage{utf8}` or by `\input utf8.sty`.

UTF-8 (UNICODE Transmission Format, see table 7.4) is a multi-byte encoding which, for Arabic and Hebrew, uses two bytes per character whereas ASCII characters use a single byte. Far-eastern languages are encoded in three bytes per character. This is in contrast to UNICODE itself which always uses two bytes per character.

The module is activated by `\setcode{utf8}`; all following Arabic and Hebrew text will be considered to be coded according to the UTF-8 encoding standard. To use the correct font, select the appropriate language. The ArabT<sub>E</sub>X notation may be reactivated by `\setcode{arabtex}`.

## 7.7 Hebrew transcription systems

`\transtrue` activates the standard ZDMG transcription, and there are provisions for additional transcription systems:

- `\settrans{zaw}` switches to the conventions of “Zeitschrift für die Alttestamentliche Wissenschaft” (recommended);
- `\settrans{gesenius}` activates the system used in W. Gesenius’ Hebrew Grammar, 26th edition (deprecated).
- `\settrans{standard}` restores the standard ZDMG transcription.

## 7.8 Hebrew fonts

- As a default, the fonts “`hclassic`” (default) and “`hcaption`” are distributed with ArabT<sub>E</sub>X. Switch to “`hcaption`” by `\hp`, and back by `\hc`.

	058	059	05A	05B	05C	05D	05E	05F
	D680	D690	D6A0	D6B0	D780	D790	D7A0	D7B0
0				ן	׀	א	נ	ו
1				ף	ׁ	ב	ס	ׂ
2				ׂ	ׁ	ג	ׄ	ׂ
3				ׂ	ׁ	ׁ	ׁ	,
4				ׁ	ׁ	ׁ	ׁ	ׁ
5				ׁ		ׁ	ׁ	ׁ
6				ׁ		ׁ	ׁ	ׁ
7				ׁ		ׁ	ׁ	ׁ
8				ׁ		ׁ	ׁ	ׁ
9				ׁ		ׁ	ׁ	ׁ
A				ׁ		ׁ	ׁ	ׁ
B				ׁ		ׁ	ׁ	ׁ
C				ׁ		ׁ	ׁ	ׁ
D				ׁ		ׁ	ׁ	ׁ
E				ׁ		ׁ	ׁ	ׁ
F				ׁ		ׁ	ׁ	ׁ

Table 7.4: UNICODE Hebrew

These fonts have been designed and donated by Joel Hoffman, who also wrote several macro packages from which we took a few ideas for positioning punctuation. There is a variety of other usable fonts on the CTAN archives.

- If no vowel points are required, all the standard fonts "DeadSea", "OldJaffa", "TelAviv", and "Jerusalem" can be used if locally available. They are activated by the commands `\ds`, `\oj`, `\ta`, `\jm`; the command `\hc` switches back to the default "hclassic" font.
- The "Shalom" family of fonts, if available, can be activated by `\shlmold`, `\shlmscr`, and `\shlmstk`. Their vowel points presently do *not* work since they must be handled differently from the ArabTEX strategy.
- In case a font appears to be locally available but is not found, check and, if required, correct the exact spelling of the font name within the file "`uheb.fd`". We have seen various incompatible variants on CTAN and on the InterNet.
- Activating other Hebrew fonts by the command `\sethebfont{font}` might work.

*Note:* We recommend to set `\lineskiplimit -20pt` whenever Hebrew and Roman script are used within the same paragraph; this will lead to uniform line spacing. The value of `\baselineskip` may have to be adjusted.

## 7.9 Judeo-Arabic

Some mediaeval manuscripts contain Arabic texts written using an extended Hebrew notation. There appear to be several conventions;<sup>1</sup> one of them is given in Table 7.5.

Judeo-Arabic mode is supported by default. Hebrew output can be globally activated by the language selection command `\setjadarab`; switch back to Arabic by `\setarab`. Input text is assumed to be in one of the supported input notations for Arabic.

This mode is still experimental; neither Hebrew vowel points nor Arabic diacritics are presently provided. Prospective users of this mode are invited to contact the author for discussing some open issues.

---

<sup>1</sup>Unfortunately we cannot read Hebrew, so the relevant literature is not accessible to us.

Table 7.5: Judeo-Arabic encoding

## 7.10 Yiddish

Yiddish, originally a dialect of Mediaeval German containing many Hebrew loan words, is commonly written phonetically using an extension of the Hebrew character set whenever available, otherwise using Roman (ASCII) letters in the YIVO standard (which we were yet unable to locate).

For writing Yiddish using Hebrew letters, load the package `yiddish.sty`, and globally activate the Yiddish mode by `\setcode{yiddish}`. The character assignment is given in Table 7.6.

Since all required vowels are provided, there will be no Hebrew vowel points, nor *dagesh*, *meteg*, and *raphe* except for denoting soft consonants.

Some words of Hebrew origin may not be rendered correctly this way; in these cases switch temporarily to Hebrew mode by `\setcode{standard}` (and switch back later by `\setcode{yiddish}`) and use the standard ArabTEX encoding.

## Miscellaneous features

.k	ك	k	<i>kāf</i> in the final position without a mark
^d	ڏ	ڏ	<i>dāl</i> with a dot below
.f	ڻ	ڻ	<i>fā'</i> without a dot
.b	ڻ	ڻ	<i>bā'</i> without a dot
.n	ڻ	ڻ	<i>nūn</i> without a dot
Y	ڙ	ڙ	'alif <i>maqsūra</i> ; <i>yā'</i> without dots in all positions

Table 8.1: Additional codings for special purposes.

### 8.1 Additional codings

To reproduce exotic, erroneous or archaic texts exactly as they are written, some additional codings are available, see Table 8.1.

If further variants are needed, write to the author and indicate:

- the required shape,
- the assumed transliteration,
- a suggestion for the input coding,
- some information on the intended use.

We are willing to consider any suggestion. Adding a new character might be easy, or else it might be outright impossible. ArabTEX is rather flexible, but there are also some technical limitations.

## 8.2 Dots on *yā'*

Whether *yā'* in the final position carries dots or not is controlled by the chosen language convention. You can override this, after selecting the language, by `\yahdots` and `\yahnodots`.

## 8.3 Vowel positioning

In vowelized Arabic text, the short vowel marks are by default positioned close to the basic character glyphs. If this is not wanted, they may be raised to approximately uniform height by the command `\accentshigh`. You may revert to the default strategy by `\accentslow`.

## 8.4 Abjad numerals

The command `\abjad {#1}` will convert its argument, which has to be a legal representation of a number between 1 and 1999, to the Arabic '*abjad*' notation used in some mediaeval manuscripts. The result of the conversion will not look perfect, and the legal '*abjad*' number 0 can presently not be generated. The command `\abjad{#1}` can be used inside and outside of an *Arabic context*.

This routine profited greatly from suggestions by Dr. Benno van Dalen (Utrecht University).

## 8.5 Automatic stretching

For special purposes, e.g. for headlines and for Arabic paragraphs containing long mathematical or non-Arabic insertions, the connection between adjacent Arabic letters may be made “elastic”, if they form no ligature. Thus a *kašīda* is inserted whose length will be adjusted automatically to uniformly fill the output line.

This feature increases the already high storage demands of ArabTEX, and should therefore be used sparingly. It can be switched on with `\spreadtrue` and switched off again with `\spreadfalse`. Inside an *Arabic Environment*, it will also be switched off automatically at the end of every paragraph.

## 8.6 Uniform baselines

The Arabic and Hebrew fonts are optically compatible with the standard Roman fonts, but have larger ascenders and descenders; this will lead to unequal distances between the baselines of consecutive lines, especially if Roman and non-Roman text are mixed within the same Roman paragraph.

Typesetting on a grid will improve line spacing. We recommend to set `\lineskiplimit -20pt` whenever Roman script and Arabic and/or Hebrew are used within the same Roman paragraph. The value of `\baselineskip` may have to be adjusted; with L<sup>A</sup>T<sub>E</sub>X use `\baselinestretch`.

Also within an *Arabic environment* typesetting on a grid may lead to a better result.

## 8.7 Verbatim copy of the input

For testing purposes, the Arabic input may be reproduced verbatim after `\showtrue` in addition to the normal output; `\showfalse` switches this feature off again. Commands will not usually be shown. The output will generally not look pleasant, and this feature is only provided in order to trace down errors, or to demonstrate the operation of ArabT<sub>E</sub>X as in the examples above.

## 8.8 Progress report

Since ArabT<sub>E</sub>X is still rather slow (due to evolving technology it is getting faster every year), it will produce some terminal output while running to indicate it is still alive. If that is not wanted, e.g., on a very fast computer system, or while running a batch job, say `\quiet` or `\tracingarab = 0` (outside an *Arabic Environment*; otherwise say `\doassign {\tracingarab }{0}`). The setting `\tracingarab = 1` will only report Arabic paragraphs, a value of 2: Arabic lines and insertions, a value of 3 or more: individual *Arabic items*.

## 8.9 Module Reporting

A complete list of the modules loaded in a particular run will be put into the T<sub>E</sub>X log file (before the run statistics), if L<sup>A</sup>T<sub>E</sub>X is used. This is believed to be useful when tracing down errors. This list is also available to the user, even with Plain T<sub>E</sub>X, as the contents of the control sequence `\arabtexconfig`.

# Chapter 9

## Compatibility issues

ArabT<sub>E</sub>X relies only on part of the powerful features of the T<sub>E</sub>X typesetting engine (neither mathematical mode nor the alignment mechanism are used), and few of the features provided by the Plain T<sub>E</sub>X package and none of L<sup>A</sup>T<sub>E</sub>X are required, but may be necessary in other parts of a multi-lingual document. Of course, T<sub>E</sub>X's macro processor is very heavily used.

It turned out that ArabT<sub>E</sub>X could be made to cooperate with a number of other macro packages, sometimes after some adjustments to ArabT<sub>E</sub>X when detecting the presence of another system, and sometimes by compatible adjustments to the other system. However there are some problem areas:

- The resource requirements of ArabT<sub>E</sub>X and usually also of the other packages are very high, and might reach the limits of a small T<sub>E</sub>X system. Fortunately, nowadays very large T<sub>E</sub>X implementations are available.
- The running time is not negligible (however, computers are still becoming faster, and typesetting this very document takes only about 20 seconds on a Pentium 233 PC running emT<sub>E</sub>X).
- Tracking down errors in a combination of several large macro packages might be difficult and time consuming.
- There might be conflicts between the names of internal commands of several packages. The resulting effects can be very obscure; there seems to be no easy solution.
- ArabT<sub>E</sub>X assumes that the special and punctuation characters have their original category codes both when it is loaded, and when Arabic processing begins. If some macro package changes these codes, Arabic processing will usually be broken. This does not apply to Babel nor to "*german.sty*"; these packages are specially handled.

- Conversely ArabTeX changes the category code of < which might break other packages. Loading ArabTeX as the last module usually helps, and enables ArabTeX to detect the presence of other packages.

## 9.1 Arabic document classes

The experimental L<sup>A</sup>T<sub>E</sub>X2<sub>E</sub> classes "arabart", "arabbook", "arabrep" extend the standard classes "article", "book", and "report" in several respects: The overall document layout has been "arabized": page numbers are in Indic numerals, and columns run from right to left. The format of running heads depends on the context of the corresponding sectioning commands.

Within Arabic environments which are bracketed by `\begin{RLtext}` and `\end{RLtext}` most L<sup>A</sup>T<sub>E</sub>X commands and environments are allowed, including all sectioning commands, `\tabular`, `\tabbing`, even `\tableofcontents`, and use an "Arabic looking" format. All arguments that denote text to be typeset are interpreted according to the currently activated Arabic encoding. Other arguments keep their L<sup>A</sup>T<sub>E</sub>X standard meaning, including the preamble of `\tabular`, whose columns are processed from left to right (visual formatting). Generally only the basic functionality is available; optional arguments in brackets are not yet supported.

The commands `\pagenumbering{abj}` and `\abj{ctr}` generate "'abjad" numerals for page numbers and/or arbitrary L<sup>A</sup>T<sub>E</sub>X counters.

The document will start out in Roman mode, but may even be made into a single *Arabic environment*. Outside of Arabic environments the L<sup>A</sup>T<sub>E</sub>X commands revert to their standard meaning. The `picture` environment and mathematical displays presently only work in Roman mode, but may contain *Arabic insertions*.

## 9.2 Using ArabTeX with EDMAC

ArabTeX will cooperate with EDMAC, a Plain TeX macro package for critical editions, written by John Lavagnino and Dominik Wujastyk. If EDMAC is already present when ArabTeX is loaded, the EDMAC commands will, after suitable local modifications, be available inside an *Arabic environment*. Their arguments are considered Roman text but may contain *Arabic quotations*.

For further details, see the EDMAC documentation.

EDMAC has been extended to work with L<sup>A</sup>T<sub>E</sub>X too, and ArabTeX still cooperates most of the time. However the three macro packages involved are very complicated and interact in very subtle ways, so the user may sometimes get a surprise. In this case, please contact the author.

### 9.3 Using ArabTeX with Babel

The Babel package by Johannes Braams provides support for multi-lingual texts in a large number of, mostly European, languages. ArabTeX does not use the language-switching facilities provided, but is otherwise compatible.

If ArabTeX is used in a Babel document, “Roman insertions” within an *Arabic context* are interpreted according to the presently active Babel language mode. Conversely, a “Roman paragraph” in a Babel document may contain *Arabic insertions*.

### 9.4 Using ArabTeX with PicTeX

With some caution, ArabTeX can be used together with PicTeX. However, PicTeX uses the angle brackets < and > for labeling diagrams, and this requires switching off their special meaning within ArabTeX by the command \setnone. Therefore short *Arabic insertions* must be included as arguments of \RL{ } or bracketed with < and >.

### 9.5 Using ArabTeX with CJK

The CJK package by Werner Lemberg, supporting typesetting of texts in Chinese, Japanese, and Korean, to our surprise proved to be compatible with ArabTeX (after a very small adjustment). Due to the high resource requirements of both packages, a *Very Big TeX* may be required for processing texts of substantial size.

# Chapter 10

## Acknowledgments

The development of ArabTEX would not have been possible without the assistance of many people, and it is impossible to acknowledge every individual contribution. Besides our local team, i.e. Udo Merkel and Heribert Schlebbe, helpful advice came, among others, from Chahriar Assad, Benno van Dalen, Ivan Derzhanski, Wolfdietrich Fischer, Ahmed El-Hadi, Yannis Haralambous, Abdelsalam Heddaya, Nicholas Heer, Taco Hoekwater, Yussuf Jabri, Iqbal Khan, Tom Koornwinder, Eberhard Krüger, Asif Lakehsar, Jan Lodder, Richard Lorch, Pierre MacKay, Eberhard Mattes, Fathy Neamat-Allah, Anshuman Pandey, Bernd Raichle, Ulrich Rebstock, Adrian Rezus, Paul Roochnik, Mohamed Saba, Waheed Samy, Annemarie Schimmel, Nariman Shehab, Arian Verheij, Dominik Wujastyk, and Michio Yano. We also have to thank all users who sent error reports, comments, and suggestions.

## Appendix A

# Obtaining and installing ArabTeX

### A.1 Obtaining ArabTeX

The ArabTeX system is available from the author's institution (by anonymous FTP from `ftp.informatik.uni-stuttgart.de` (129.69.211.2), in the directory `pub/arabtex`) and from many other common servers, e.g. the CTAN network

- `ftp.dante.de/tex-archive/language/arabtex`
- `ftp.tex.ac.uk/tex-archive/language/arabtex`
- `ctan.tug.org/tex-archive/language/arabtex`

The files may be transferred individually or as a package: `arabtex.zip` for PC systems, `arabtex.tar.Z` for U\*IX systems; we recommend to get and inspect the file `arabtex.htm` or `readme.txt` first. Successfull operation on the Apple Macintosh in conjunction with OzTeX has also been reported.

At the time of this writing, version 4.00 is current. The Nasta'liq font is still under development; Naskh will be substituted automatically.

ArabTeX is being maintained and extended, if required, on a regular schedule. The current status can be found in the file `arabtex.htm` or by sending an EMail message (with arbitrary content) to

`arabtex@informatik.uni-stuttgart.de`

## A.2 Installing ArabTeX

The installation procedure is strongly system dependent, and we recommend securing the assistance of a local TeXpert. You have to install the fonts provided ("nash14", "nash14bf", "xnsh14", "xnsh14bf", "hclassic", "hcaption") with their "\*.pk" and "\*.tfm" files on the font search path of your TeX system, and the "\*.sty" files, "arabtex.tex", and "hebtex.tex" on the source search path (usually TEXINPUT) of your system. Possibly you will also have to rename the "\*.pk" files according to local conventions, and as a last resort you can try to recreate the fonts from the "\*.mf" METAFONT sources. Additional fonts, whenever available, are installed analogously.

ArabTeX has been found to cooperate well with TeX versions 3.xxx, L<sup>A</sup>T<sub>E</sub>X2<sub>ε</sub>, L<sup>A</sup>T<sub>E</sub>X versions 2.09 of 1991 or later, MITeX, NFSS and NFSS2 (not required), and previewers that can handle fonts of more than 128 characters. TeX-XET or TeX--XET are not required, and their additional features are presently not exploited.

The TeX “hash size” should be at least 3000 to 3500, especially when using ArabTeX in conjunction with L<sup>A</sup>T<sub>E</sub>X, and if the transliteration module is used. Use of a BIG TeX may be necessary when using the NFSS2 due to the latter’s high demand on string storage. Space and time requirements are not negligible, and have increased during development; however, ArabTeX currently still runs, albeit slowly, even on a PC XT standard configuration.

## **Appendix B**

### **Release history**

The development of the ArabTeX system began around 1991 as a private project of the author, for his personal use. However it turned out soon that the package, if at all feasible, could be of use for others also who see the need of printing Arabic text without involving a special publishing agency. As prospective users we mainly considered Orientalists which we believed very short on funding (this proved to be a drastic understatement). There was no Arabic word processing available at that time, and using TeX as a platform looked like the only remaining possibility except perhaps implementing some complete system from scratch, which probably would necessitate building multiple versions for various computer platforms and operating systems, which we did neither dare nor could afford.

Basing the design on TeX required the minimal user interface to become extremely lean, to facilitate the use by non-programmers. In fact, only three commands and the input notation conventions have to be learned, once the user is familiar with TeX or L<sup>A</sup>T<sub>E</sub>X, to be able to use ArabTeX for a standard Arabic document. Additional features can be looked up as required.

Using the TeX typesetting engine as a machine independent platform suggested implementing the internal algorithms in TeX's powerful internal macro language. Unfortunately, it is not easy to use, and errors can be very hard to find and eliminate.

#### **ArabTeX version 1.00**

ArabTeX version 1.00 was a prototype, to check the basic feasibility of our approach, and to get some operating experience. Many of its features were only available in a very primitive form. It is no more supported.

## ArabTeX version 2.00

ArabTeX Version 2 was the first stable version of ArabTeX. It was not fully compatible with Version 1; however, moving to the new version usually caused little problems. Apart from some extensions, most changes were introduced in order to better conform to the transliteration standards, and to have less compatibility problems with TeX and L<sup>A</sup>T<sub>E</sub>X.

The main differences between versions 1 and 2 were:

- The font size was increased, so the document layout changed. The old font "nash10" was abolished and replaced by "nash14"; the character locations have been assigned differently.
- Some Arabic characters were now coded differently: 'ayn is denoted by a left quote, and <c>, <<sup>z</sup>>, <<sup>t</sup>>, and <.n> have been assigned new meanings in order to better conform to the standard transliteration.
- Many more ligatures than before were supplied. This normally did not concern the user.
- \vocalize no more generated *sukūn* and *wasla* except if explicitly indicated by quoting. See \fullvocalize.
- Arabic Environments are now always bracketed by the new control sequences \begin{arabtext} and \end{arabtext} even if only the transliteration is wanted.

## ArabTeX version 3.00

The changes introduced in Version 3.00 fall into one of two categories: error corrections, and upward compatible extensions. Details are not given here, but are documented in the text file "changes.txt" that is part of the distribution package of ArabTeX. The earlier change history up to Version 3.00 is described in the text file "changes2.txt".

Version 3 is upwards compatible with version 2. However, many new features were introduced gradually, among them support for additional input encodings and a multitude of languages that use the Perso-Arabic script. We gratefully acknowledge the cooperation of several users who contributed information, documentation, and even helped with the coding.

On some users' request, a Hebrew mode was added, as well as support for nearly all the Hebrew TeX fonts that are available on the CTAN server network.

## ArabTeX version 4.00

Version 4 is an upwards compatible extension of version 3, and many modules have been rewritten. All presently supported features are documented in this manual. It proved impractical to indicate every extension explicitly; the basic user interface is still the same.

In a few instances we had to abolish certain old features that, to our knowledge, were rarely used or not at all, because of ambiguities or conflicts with the extensions. These places are indicated in the manual, and are flagged by an asterisk in the margin.

The most important incompatible changes are:

- \*
  - Tilde (<~>) is no more used as a prefix in the transliteration encoding, because of conflicts with TeX's use of tilde for a stable space. Caret (<^>) is now used instead in all cases.
  - The double bar (<||>) for indicating a small unbreakable space has been replaced by <\, >.

Users who still need the old features should contact the author; there might be a workaround.

## Appendix C

# Miscellaneous utilities

The following packages are not part of ArabTeX proper, and are not supported in any way, but are distributed along with ArabTeX as possibly a convenience to the users. There is no warranty whatsoever.

### C.1 `twoblks.sty`

This L<sup>A</sup>T<sub>E</sub>X option will define a command `\twoblocks {#1}{#2}` which will place the two parameters #1 and #2, usually two paragraphs, into two boxes side by side, separated by space of length `\colsep`. If necessary, the resulting boxes will be split across a page boundary.

This feature is useful if two versions of a text are to be contrasted. They may be in different languages, and one of them might be in Arabic (if enclosed in `\begin{arabtext} ... \end{arabtext}`).

This sentence has been written twice: in the English language and in the Arabic language.

كُتِبَتْ هَذِهِ الْجُمْلَةُ مَرَّتَيْنِ: بِاللُّغَةِ  
الْأَنْجِلِيزِيَّةِ وَبِاللُّغَةِ الْعَرَبِيَّةِ.

Otherwise this command does not depend on ArabTeX in any way, and indeed originated in a completely different context.

Beware that the two “blocks” should each not contain much more than one, not too long, paragraph of text, otherwise T<sub>E</sub>X’s main storage might overflow. There must be no `\verbatim` text inside the parameters of `\twoblocks`, nor any `\catcode` changes; and all T<sub>E</sub>X groups and `\if ... \fi` sequences must be properly nested.

## C.2 `verses.sty`

This is a small utility for typesetting classical Arabic poetry in two parallel blocks, such that every line contains two half-verses. For its use, see the file itself.

حَاجُلْ قُلُوبِ الْعَارِفِينَ بِرَوْضَةِ تَكَنَّفَهَا مِنْ عَالَمِ السَّرِ قُرْبَةِ وَأَرَوَى صَدَاهَا كَأْسَ صِرْفِ بِحَبَّهِ فَيَا لِقُلُوبِ قُرَبَتْ فَتَشَرَّبَتْ رِضَيَهَا فَأَوْضَاهَا حَازَثَ مَدَى الرَّضَى لَهَا مِنْ لَطِيفِ الْعَرْمِ عَزْمُ سَرْثُ بِهِ سَرَى بِرُّهَا بَيْنَ الْحَبِيبِ وَتَيْنَهَا	تَمَاوِيَةٍ مِنْ دُونَهَا حُجْبُ الرَّبِّ فَلَوْ قَدَّرَ الْأَجَالَ ذَابَثُ مِنَ الْحُبَّ وَبَرْدُ نَسِيمٍ حَلَّ عَنْ مُنْتَهَى الْخَطَبِ لِذَا الْعَرْشِ مِنَ رُينَ الْمَلِكِ بِالْقُرْبِ وَحَلَّثُ مِنَ الْمَحِبُوبِ بِالْمُنْزِلِ الرَّحْبِ وَهَتِيكُ بِالْأَفْكَارِ مَا دَاخَلَ الْحُجْبِ فَأَصْحَى مَصْوَنًا عَنْ سَوَى الْقُرْبِ فِي الْقُرْبِ
--	--

Figure C.1: Example of Arabic poetry (source unknown)

## C.3 `raw.sty`

This is a small utility to ease the processing of input files that have been produced by some OCR reading program. It will deactivate most of TEX's special characters.

This package depends strongly on the special application; if you need it or a variant of it, enquire with the author.
